VOL. XXXIV LITTLE ROCK, ARK., JANUARY, 1929 No. 1

GENERAL SUMMARY

Considered as a whole, the weather in Arkansas during January, 1929, averaged somewhat cooler and wetter than normal with no record breaking extremes reported. The month opened with moderately cold weather and temperatures were almost uniformly below normal except on the 9th and 10th and from the 17th to the 22d when the highest for the month occurred. The mean temperature for the month, as determined from the records of 58 stations was 39.4° which is 1.7° below normal. Of the stations for which normals have been computed, all except 9 showed negative departures. Monthly means ranged from 46.8° at Portland to 33.2° at Bentonville, a difference of 13.6° between the northwestern and southeastern portions of the State. The highest temperature reported was 79° at Hope on the 18th, the lowest, 2° at Dutton on the 2d and Gravette on the 6th. The highest occurred in most sections on the 18th or 22d and the lowest about the 2d or 6th. The greatest daily range was 57° at Mammoth Spring on the 25th.

The average precipitation for 90 stations was 5.08 inches which is 0.98 inch above the January normal. Monthly totals ranged from 8.00 inches at Dutton to 2.35 inches at Arkansas City. Practically all precipitation fell as rain, the snowfall at 9 stations averaging only 1.0 inch. Negative departures occurred at 20 stations, positive at all others. Little rain fell in the State on the 2d, 3d, 7th, 8th, 11th, 12th, 13th, 14th, and from the 26th to the close of the month while on other days moderate to heavy showers were numerous, the average number of rainy days being 10 which is three more than normal for the month.

The weather during the month was generally unfavorable for farm work and other outdoor pursuits, frequent rains keeping the soil too wet for plowing and frequent freezing and thawing periods were unfavorable for wheat and oats. The cool weather kept vegetation dormant. Heavy rains the latter part of the month caused flood stages on the smaller streams of the State and moderate stages on the Arkansas, however little damage resulted.

W.C.H.

VOL. XXXIV LITTLE ROCK, ARK., FEBRUARY, 1929 No. 2

GENERAL SUMMARY

The weather in Arkansas during February was unusually cold, the mean temperature, 35.4°, being the lowest February mean since 1905. Daily means were almost uniformly below normal, not more than three days having a positive departure, these the latter half of the month. Monthly means ranged from 42.6° at Junction to 28.4° at Dutton, a difference of 14.2° between northwestern and southern sections of the State. Extremes ranged from 20° below zero at Lead Hill on the 10th to 76° at Portland on the 25th. Extremes occurred on approximately these dates at most stations. Of the 60 stations at which temperature records were kept, all showed negative departures for the month, 14 recorded monthly means below freezing, and 16 temperatures of zero or lower. Twenty below at Lead Hill is the lowest February temperature reported in the State since February 13, 1905, when 29° below was recorded at Pond, Newton County. The greatest daily range was 56° at Harrison on the 10th.

The average precipitation for 90 stations was 4.01 inches which is 0.96 inch above normal. Practically all stations in the mountainous sections of the State showed positive departures while negative departures occurred at numerous stations in the lowlands. Monthly totals ranged from 1.97 inches at Amity to 6.29 inches at Waldron. Snowfall was unusually heavy, the average for 69 stations being 11.5 inches, monthly totals ranging from a trace at a few southern stations to 27.5 inches at Gilbert. Some stations showed a trace or more on the ground the entire month. Most of the snow fell during the first week of the month and on the 18th, 19th, and 20th, southern stations showing the greatest fall on the 20th. Sleet and glaze were reported at numerous stations during the month, but damage therefrom was slight. The greatest precipitation for any 24-hour period was 2.90 inches at Paragould and Piggot on the 25th. The average number of days with 0.01 inch or more precipitation was 10.

Heavy precipitation the latter part of the month brought flood stages on the smaller streams of the State and moderately high stages on the Arkansas and White rivers. Some lowland was flooded, but little damage resulted. The month as a whole was unfavorable for outdoor work and but little plowing and preparation for planting was possible. The snow cover was favorable for winter grain crops and for meadows and pastures, but low temperatures damaged oats and truck crops. Fruit remained dormant.

W.C.H.

CLIMATOLOGICAL DATA

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU
ARKANSAS SECTION
HARVEY S. COLE, Meteorologist

VOL. XXXIV   LITTLE ROCK, ARK., MARCH, 1929   No. 3

GENERAL SUMMARY

The outstanding characteristics of the weather in Arkansas during March, 1929, were the positive temperature and negative precipitation departures. Practically all stations showed positive temperature departures for the month and the highest March temperatures on record were recorded in most sections on the 24th. The highest for the month was 98° at Harrison on the 24th, the previous highest on record being 96° in 1907 and 1918. The month opened with cool weather and daily means were below normal most of the first decade, the lowest temperatures of the month occurring in most sections on the 1st, 2nd, or 10th. After the 10th the temperature was generally above normal with unseasonably high day temperatures from the 21st to the 26th. The mean temperature for the month, as determined from the records of 59 stations, was 55.7° which is 3.0° above normal. Monthly means ranged from 60.9° at Portland to 49.7° at Dutton and Mammoth Spring, a difference of 11.2° between the northern and southern sections of the State.

There were frequent showers during the month, but daily amounts were mostly light. The number of rainy days was ten, two above the normal number, but the average precipitation for 89 stations was only 3.77 inches which is 0.97 inch below normal. Monthly totals ranged from 6.27 inches at Clinton to 1.35 inches at Cotter. Lurton reported 0.5 inch of snow during the month, traces at five other northwestern stations, all other precipitation falling as rain. Frequent showers kept the soil too wet for plowing most of the month and at the close of the month all farm work was backward. Truck, gardens, fruit, and strawberries made excellent progress and early berries were blooming at the close of the month. The Mississippi River was high the latter part of the month, but all Arkansas streams remained at comparatively low stages. W.C.H.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

THUNDERSTORMS:--1st, 1; 2d, 2; 3d, 11; 4th, 11; 5th, 5; 6th, 1; 8th, 3; 9th, 6; 12th, 9; 13th, 4; 14th, 8; 15th, 11; 19th, 16; 20th, 11; 21st, 5; 22d, 5; 23d, 1; 25th, 1; 26th, 10; 27th, 5; 28th, 6; 29th, 13; 31st, 23.

DENSE FOG:------4th, 4; 12th, 1; 13th, 11; 14th, 21; 15th, 1; 17th, 1; 21st, 6; 30th, 3.

SOLAR HALOS:---1st, 1; 2d, 1; 4th, 1; 7th, 2; 10th, 1; 13th, 1; 20th, 1; 21st, 1; 24th, 1; 25th, 2; 30th, 2.

LUNAR HALOS:---7th, 1; 18th, 1; 20th, 2; 21st, 2; 24th, 1; 25th, 1.

Moderate Hail:--Brinkley, 14th: Dardanelle, 31st: slight damage.

Heavy Hail:------Crossett, 12th: slight damage. Winslow, 31st: considerable damage.

High winds--straight blows: Throughout most of State 31st: slight damage.

ARKANSAS SECTION

HARVEY S. COLE, Meteorologist

VOL. XXXIV LITTLE ROCK, ARK., APRIL, 1929 No. 4

GENERAL SUMMARY

The outstanding features of the weather in Arkansas during April were the positive temperature and precipitation departures and destructive storms on the 10th, 14th, 20th, and 21st. The positive temperature departure for the month was brought about by a rather unusual condition. The first decade was unseasonably warm, daily means being as much as 18° above the seasonal average a few days, but after the 10th cooler weather prevailed the remainder of the month with daily means below normal most of the time.

The mean temperature for the month, as determined from the records of 58 stations, was 64.0° which is 2.6° above normal, all stations for which temperature normals have been computed showing positive departures. Monthly means ranged from 57.6° at Dutton to 70.6° at Junction, a difference of 13° between northwestern and southern sections of the State. Extremes ranged from 92° at Prescott on the 8th to 29° at Dutton on the 1st. Killing frost occurred in a few localities on the 1st and light frost at several stations about the 10th or 12th.

The average precipitation for 87 stations was 5.69 inches which is 0.81 inch above normal. Monthly totals ranged from 1.91 inches at Amity to 12.94 inches at Marshall. The number of rainy days was considerably above normal in some sections of the State, several stations reporting 12 to 18 days, the average for the entire State being 10. The heavy rains kept all streams at moderately high stages most of the month, the Black being above flood stage practically the entire month, the upper White above flood stage the 9th to the 11th and the lower White after the 20th. The Arkansas slightly exceeded flood stage at Fort Smith, Dardanelle, and Morrillton while the lower Arkansas was flooded most of the month by the high water on the Mississippi. Flood loss was not large, little farm work having been done and no crops planted.

The weather as a whole was rather unfavorable for farm work, the latter part of the month being too cool for cotton to germinate well and showers were too frequent for cultivation. Corn, where up and cultivated, was in good condition at the close of the month. There was too much rain for strawberries. W.C.H.

CLIMATOLOGICAL DATA

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU
ARKANSAS SECTION
HARVEY S. COLE, Meteorologist

VOL. XXXIV LITTLE ROCK, ARK., MAY, 1929 No. 5

GENERAL SUMMARY

The weather in Arkansas during May, 1929, was marked by temperatures below and precipitation above normal. The month opened with cool weather, the lowest for the month occurring in most sections on the 2d or 3d. Daily means were almost uniformly below normal during the first decade and from the 16th to the 25th, slightly above during the other periods with the highest for the month generally on the 30th or 31st. The lowest temperature for the month was 30° at Dutton and Thornburg on the 3d. The lowest temperature on record in Arkansas for the month of May was 24° at Pond, Benton County, (near Gravette), on May 1, 1903. The extreme of 97° at Hope and Pine Bluff on May 31st has frequently been exceeded. The mean temperature for the month, as determined from the records of 60 stations, was 67.6° which is 1.4° below normal. All stations for which normals have been computed showed negative departures except Dardanelle, El Dorado, Marianna, and Portland.

May was a cloudy showery month, rain being reported at one or more stations in the State every day during the month except the 21st and 22d. The average precipitation for 90 stations was 6.31 inches which is 1.20 inches above normal. Monthly totals ranged from 1.98 inches at Princeton to 11.52 inches at Wynne. Seven stations reported over ten inches rainfall. Most of the rain fell as light to moderate showers, the greatest 24 hour precipitation being 4.90 inches at Wynne on the 25th. The average number of days with 0.01 inch or more was 13, 5 above normal. Several stations reported as many as 20 days with a trace or more.

Moderately high stages prevailed in most streams of the State the closing days of April, the lower Arkansas and the lower White being above flood. The rains of May brought flood stages on the principal streams, prolonging the flood in the eastern lowlands. Highway No. 70 to Memphis was inundated most of the month necessitating long and difficult detours. It is estimated that 800 square miles were overflowed by the White and 500 square miles by the Arkansas. It is thought the entire loss in the State approximates $970,000. Much of the inundated land was not in cultivation and most that is in cultivation was not planted.

The weather was rather unfavorable for farm work, being too cool for growth and too wet for cultivation of cotton. Stands were poor in many localities and the crop badly in need of cultivation at the close of the month. Strawberries were damaged by the frequent showers. Hay crops made good progress.

W.C.H.

Corrections: April, 1929

Amity: Monthly mean temperature should be 64.8, departure +3.6. Higden: number cloudy days should be 15. Pocohontas: greatest 24 hour precipitation should be 1.20. Subiaco: greatest 24 hour precipitation should be 2.00, number days 0.01 or more precipitation 10.

VOL. XXXIV LITTLE ROCK, ARK., JUNE, 1929 No. 6

GENERAL SUMMARY

The weather in Arkansas during June averaged slightly cooler and drier than normal with no record breaking extremes recorded. The mean temperature for the State, as determined from the records of 60 stations, was 76.2° which is 0.9° below normal. Positive departures were recorded at several stations south of the Arkansas River, at one northern and two eastern stations, negative at all other. Monthly means ranged from 69.6° at Dutton to 83.8° at Hope, a difference of 14.2° between the northwestern and southern sections of the State. Extremes ranged from 41° at Thornburg on the 4th to 102° at the same station on the 19th. The lowest occurred in practically all sections on the 4th while the highest occurred about the 19th or the 30th. The greatest daily range was 43° at Harrison on the 4th.

The average precipitation for the State, as determined from the records of 91 stations, was 3.68 inches which is 0.34 inch below normal. Positive departures occurred at numerous stations in the northern half of the State while the southern counties were uniformly dry. Monthly totals ranged from 8.05 inches at Bentonville to 0.02 inch at Camden. The greatest amount measured in any 24 hour period was 3.93 inches at Ozark on the 23d. The average number of rainy days was 7. The northwestern section of the State was by far the wettest, several stations having as many as 14 rainy days during the month while in the southern counties only two rainy days were reported at several stations.

The weather was mostly favorable for all crops in the northern half of the State, but it was too dry for corn in many localities in southern counties. Cotton made good to excellent progress except in a few localities where there was too much rain. Chopping was about completed at the close of the month and the crop as a whole was clean, well cultivated, and making rapid growth. Corn was hurt by the dry weather in southern and southeastern sections of the State, but elsewhere the crop made excellent progress. The weather was favorable for haying and all minor crops made satisfactory progress. W.C.H.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

THUNDERSTORMS:--1st, 15; 2d, 21; 3d, 17; 5th, 16; 6th, 8; 7th, 30; 8th, 12; 11th, 6; 12th, 15; 13th, 40; 14th. 12: 15th, 1; 19th, 10; 20th, 8; 21st, 24; 22d, 17; 23d, 20; 24th, 28; 25th, 6; 27th, 2; 28th, 2.

DENSE FOG:------4th, 1; 8th, 2; 9th, 1; 10th, 1; 14th, 1; 15th, 1; 20th, 1; 24th, 1.

SOLAR HALOS:-----6th, 1; 9th, 1; 11th, 1; 12th, 1; 19th, 1; 20th, 2; 28th, 1; 29th, 2; 30th, 1.

LUNAR HALOS:-----12th, 1; 15th, 1.

MODERATE HAIL:--1st, Pocahontas, half size hen eggs, damage $400; 13th, 5 miles north of Amity, considerable damage.

HEAVY HAIL:------13th, Rosboro, northern Pike County, considerable damage; 23d, Cauthron, 5 miles wide, considerable damage.

VOL. XXXIV LITTLE ROCK, ARK., JULY, 1929 No. 7

GENERAL SUMMARY

High day temperatures, cool nights, daily means almost uniformly above normal, abundant sunshine, and slightly deficient precipitation were the distinguishing characteristics of the weather in Arkansas during the month of July. Temperatures were generally near or slightly below normal from about the 2d to the 6th and from the 19th to the 26th, normal or above the remainder of the month. The mean temperature, as determined from the records of 60 stations, was 81.2° which is 1.2° above normal. Four northwestern stations, two northeastern, and one southeastern reported monthly means below normal while all others for which normals have been computed were above. Monthly means ranged from 74.4° at Dutton to 85.2° at Pine Bluff, a difference of 10.8° between northwestern and southeastern sections of the State. The highest temperature recorded during the month was 105° at Pine Bluff on the 17th and at Amity on the 30th, the lowest, 51°, at Dutton on the 21st. Extremes occurred on approximately these dates in most localities. The greatest daily range was 42° at Marshall on the 21st.

The average precipitation for 91 stations was 3.07 inches which is 0.75 inch below normal. Positive departures were recorded at 19 stations, confined principally to northwestern and southern sections of the State, negative at all others. An appreciable amount of rain was recorded in the State every day during the month except the 20th and 21st. Showers were heavier and more frequent during the first decade while the remainder of the month was fairly dry. Monthly totals ranged from 0.44 inch at Conway to 8.44 inches at Dutton. The geographical distribution of the rainfall was irregular, but most of the heavier totals occurred in northwestern sections while the central counties were driest. The average number of days with 0.01 inch or more precipitation was 7.

The weather of the month was mostly favorable for the growth and cultivation of cotton. The crop made excellent progress throughout the State and at the close was in very good condition with squares and blooms plentiful. Corn made good progress where showers were frequent, but in several localities in central and southern sections poor progress was reported due to the hot, dry weather. Pastures and meadows were good where showers occurred and most minor crops made satisfactory progress during the month. No damaging wind or hail storms were reported. W.C.H.

Corrections: Juue, 1929

Amity, mean temperature should be 76.0, departure +1.2.
Blytheville, highest temperature should be 96° on 16th†.
Hope, monthly mean temperature should be 78.8, departure +0.4.
Ozark, highest temperature should be 96° on 11th.
Winslow, monthly mean temperature should be 71.0, departure - 0.5.

VOL. XXXIV LITTLE ROCK, ARK., AUGUST, 1929 No. 8

GENERAL SUMMARY

The weather in Arkansas during August was marked by temperatures somewhat above normal and precipitation considerably below, this being, with one exception, the driest August since State-wide records have been kept. Daily mean temperatures were generally above normal during the first decade, near or somewhat below during the second, and mostly above during the last. The monthly mean, as determined from the records of 60 stations, was 80.8° which is 1.1° above normal, 14 stations showing negative departures, positive at all others. Monthly means ranged from 85.4° at Center Point to 75.4° at Dutton, a difference of 10° between northwestern and southwestern sections of the State. The highest temperature recorded was 110° at Booneville on the 6th. The lowest was 41° at Dutton on the 15th. The highest occurred in most localities from the 3rd to the 6th and the lowest about the 15th or 16th.

The average precipitation for the State, as determined from the records of 88 stations, was 1.29 inches which is 2.40 inches below normal, all stations showing negative departures except Brinkley. Three stations reported no rain and two others only a trace. The greatest monthly amount was 4.73 inches at St. Francis. This was the driest August on record in Arkansas except in 1909 when the average for the State was only 1.27 inches. Showers were numerous in northeastern sections of the State from the 7th to the 12th, but during the remainder of the month only light scattered showers occurred. The greatest rainfall for any 24 hour period was 3.35 inches at Oden on the 8th. The average number of rainy days was 3.

The weather of the month was favorable for the cultivation of all crops, but too dry for the growth of both cotton and corn except in a few northeastern counties. By the close of the month picking and ginning had begun in southern and central sections, much of the first opening being due to the hot, dry weather. Except in the Northeast the corn crop was badly damaged and the weather was mostly unfavorable for meadows, pastures, and truck crops.

W.C.H.

ARKANSAS SECTION

HARVEY S. COLE, Meteorologist

VOL. XXXIV LITTLE ROCK, ARK., SEPTEMBER, 1929 No. 9

GENERAL SUMMARY

For the State as a whole, September averaged drier and cooler than usual, though in some localities both the temperature and precipitation were above the seasonal average. The mean temperature for the State, as determined from the records of 32 stations, was 73.4° which is 0.8° below normal. Monthly means ranged from 67.1° at Mountain Home to 77.4° at Rison, a difference of 10.3° between northern and southern sections of the State. Extremes ranged from 102° at Magnolia on the 1st and at Hope on the 2d, to 41° at Batesville and Corning on the 19th. Extremes occurred on approximately these dates throughout the State. A minimum of 41° for September is rather high, freezing frequently occuring in northern counties the closing days of the month. Frost did not occur.

The average precipitation for 92 stations was 2.46 inches which is 0.97 inch below normal, this being the fourth consecutive month during which Arkansas' precipitation has been below normal. Of the stations for which normal have been computed, 18 showed positive departures, negative at all others. Precipitation was heaviest in western sections of the State while the least rain fell in the Arkansas and White River valleys. Monthly totals ranged from 5.86 inches at Waters to 0.31 inch at Pine Bluff. The greatest amount measured in any 24-hour period was 2.80 inches at Mount Ida on the 7th. The average number of rainy days was 5.

The weather of the month was mostly favorable for picking and ginning cotton and in some localities in southern counties picking was practically completed at the close of the month. The crop was much better in eastern than in western sections of the State. Corn was practically all matured and gathering was in progress at the close of the month. The weather was too dry for pastures, late truck, and fall plowing. The streams of the State were at low stages most of the month. Dirt roads were dusty.

W.C.H.

Corrections: August, 1929

Batesville, date of highest temperature should be 3d.
Corning, number days partly cloudy should be 6, cloudy 1.
Grannis, monthly mean temperature should be 81.1°.
Marianna, lowest temperature should be 55° on 16th.
Osceola, number clear days should be 21, cloudy 3.

VOL. XXXIV LITTLE ROCK, ARK., OCTOBER, 1929 No. 10

GENERAL SUMMARY

The mean temperature for the State, as determined from the records of 58 stations, was 62.2° which is normal, the number of stations with positive and negative departures being practically the same. Monthly means ranged from 56.2° at Dutton to 66.6° at El Dorado, a difference of 10.4° between northwestern and southern sections of the State. Extremes ranged from 93° at Hope on the 17th to 19° at Dutton on the 25th. The highest occurred in most localities about the 17th or 18th and the lowest on the 24th or 25th. Freezing temperatures and heavy to killing frost were reported over the greater part of the State on the 24th and 25th, but in some localities vegetation was not killed.

The average precipitation, as determined from the records of 88 stations, was 4.29 inches which is 1.32 inches above normal. Negative departures were recorded at fifteen scattered stations in northeastern and southern counties, positive at all others. The greatest monthly total was 9.33 inches at Marshall, the least, 1.11 inches at Paragould. Normally October is a dry month in Arkansas and was this year until the last three or four days of the month when most localities reported heavy to excessive rains. Rainfall was excessively heavy at Little Rock on the 30th, previous intensity records for October being broken for all intervals from 5 minutes to two hours and the 15 minute amount, 1.16 inches, is the greatest on record at the Little Rock station. Storm sewers were inadequate and considerable damage resulted in the down-town district. The greatest amount measured for any 24 hour period was 4.96 inches at Gravette on the 11th. The average number of rainy days was 7.

The weather of the month as a whole was favorable for picking cotton, gathering corn, harvesting rice, and other fall farm activities. At the close of the month cotton picking was nearer completed than usual and corn was practically all matured and beyond frost damage. The streams of the State were at low stages most of the month.

VOL. XXXIV LITTLE ROCK, ARK., NOVEMBER, 1929 No. 11

GENERAL SUMMARY

The outstanding characteristics of the weather in Arkansas during November were the negative temperature and precipitation departures, and the heavy snowfall, all stations for which normals have been computed showing temperatures below normal and all except 12 southern stations negative precipitation departures. This was the coldest November in Arkansas since state wide records have been kept, November, 1911, with a mean temperature of 46.8°, being the next coldest. The lowest this month, 7° at Dutton on the 30th, while unusual, is not the record low temperature for November, 2° having been recorded at Witts Springs, Searcy County, November 18, 1903.

The mean temperature for the month, as determined from the records of 61 stations, was 46.1° which is 5.5° below normal. Monthly means ranged from 39.4° at Mountain Home to 51.6° at Rison, a difference of 12.2° between northern and southern sections of the State. Extremes ranged from 85° at Rison on the 12th to 7° at Dutton on the 30th. The highest occurred in most sections about the 10th or 12th and the lowest on either the 23d or the 30th. The greatest daily range was 46° at Hope on the 28th. Killing frost or freezing temperatures occurred over the greater part of the State the latter part of October and in remaining localities about November 5th.

The average precipitation for 91 stations was 2.61 inches which is 1.04 inches below normal. Monthly totals ranged from 6.57 inches at Helena to 0.78 inch at Mountain Home. The average snowfall for 65 stations was 3.2 inches, 8.0 inches being measured at Clarendon, Dumas, and El Dorado. Snowfall was heaviest in the southern half of the State. This is the greatest November snowfall on record in Arkansas. The greatest precipitation for any 24 hour period was 3.54 inches at Camden on the 13th.

The weather for the month as a whole was unfavorable for fall farm activities, being too wet or too cold for picking cotton, gathering corn, and threshing rice and at the close of the month this work was not yet completed. The snowfall of the 21st was favorable for wheat, oats, and meadows. W.C.H.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

THUNDERSTORMS:--1st, 2; 6th, 1; 9th, 1; 10th, 2; 12th, 11; 13th, 10; 14th, 1.

SOLAR HALOS:-----24th, 1.

LUNAR HALOS:-----25th, 1.

DENSE FOG:------4th, 1; 6th, 1; 10th, 1; 11th, 2; 12th, 13; 20th, 1; 23d, 1; 26th, 4; 27th, 6.

METEOR:---Eastern half of State 9:15 p.m of the 8th.

VOL. XXXIV LITTLE ROCK, ARK., DECEMBER, 1929 No. 12

GENERAL SUMMARY

Although the mean temperature and average precipitation for the month of December were near normal, there were periods during the month with marked departures. The month opened with temperatures considerably below normal and cool weather prevailed in most sections during the first week. From the 10th to the 17th unusually warm weather prevailed, positive departures of 20° to 25° occurring. This was followed by severely cold weather from the 18th to the 24th, negative departures of 20° to 25° occurring with temperatures below zero at several northern stations. During the closing days of the month moderate temperatures again prevailed. Precipitation occurred in most sections of the State from the 13th to the 18th or 19th while during other periods amounts were light and scattered. The last decade had about one rainy day, unusually fine weather prevailing through the holidays.

The mean temperature for the month, as determined from the records of 59 stations, was 44.4° which is 1.9° above normal. Of the stations for which normals have been computed, four northern and five southern showed negative departures, positive at all others. Monthly means ranged from 37.6° at Mammoth Spring to 50.6° at Hope, a difference of 13.0° between northern and southern sections of the State. Extremes ranged from 82° at Hope on the 12th to 5° below zero at Dutton on the 20th.

The average precipitation for 90 stations was 3.84 inches which is 0.21 inch below normal. Monthly totals ranged from 5.88 inches at El Dorado to 1.51 inches at Jonesboro. The outstanding feature of the December precipitation in Arkansas was the unusually heavy snowfall in southern sections of the State on the 21st and 22d, El Dorado reporting 18.2 inches, an unprecedented snowfall for south Arkansas. The average snowfall for 65 stations was 3.7 inches.

For the month as a whole the weather was favorable for winter crops, wheat, rye, and meadows being in good condition at the close of the month. Some cotton was picked, corn gathered, and rice threshed and at the close of the month this work was practically completed. Some plowing was done, but in most sections the soil was too wet. Considerable meat spoiled during the period of high temperatures. W.C.H.

VOL. XXXIV   LITTLE ROCK, ARK., YEAR, 1929   No. 13

GENERAL SUMMARY

The outstanding features of the weather in Arkansas during 1929 were the low monthly mean temperatures of February and November, the unusually warm weather of March, heavy snowfall in February, November, and December, and the destructive storms and floods of April and May.

The mean temperature for the year was 60.5° which is 0.7° below normal. Positive departures occurred at 11 of the stations for which normals have been computed, negative departures at all others. Monthly means were normal or above in March, April, July, August, October, and December, below the other six months of the year. July, with a mean temperature of 81.2°, was the warmest month of the year while February, with a temperature of 35.4°, was the coldest. Annual means ranged from 54.5° at Dutton to 64.7° at Rison, a difference of 10.2° between northwestern and southern sections of the State. Extremes ranged from 20° below zero at Lead Hill on February 10th to 110° at Booneville on August 6th. The maximum temperature during March, 98° at Harrison on the 24th, is a new March record for Arkansas and the minimum of 41° at Dutton on August 15th is within 2° of the lowest on record for August. The mean temperature for November, 46.1°, is the lowest November mean since records have been kept in Arkansas. The temperature during the crop season, April 1st to October 31st, was 0.3° above normal.

THE LIBRARY OF THE
FEB 25 1930
UNIVERSITY OF ILLINOIS

The average precipitation, as determined from the records of 85 stations with unbroken annual records, was 46.10 inches which is 1.62 inches below normal. May, with an average rainfall of 6.31 inches, was the wettest month of the year and August, with 1.29 inches, was the driest. Annual amounts ranged from 58.72 inches at Dutton to 33.83 inches at England. Annual amounts in excess of the normal were recorded at numerous stations in the northwestern half of the State while only two stations in the lowlands of eastern Arkansas had more than normal precipitation. The annual snowfall was 19.9 inches, the greatest on record for the State. Unusually heavy snow occurred in February and again in November and December, the snows of November and December being unprecedented in the history of south Arkansas. Precipitation was above normal during January, February, April, May, and October, below the other months of the year. During the month of August five stations reported less than 0.01 inch of rain. The greatest monthly total during the year was 12.94 inches at Marshall in April. The greatest 24-hour amount recorded was 4.96 inches at Gravette, October 11th. The heavy spring rains resulted in a flood in the eastern lowlands during April and May, details being given under "Weather by Months". The precipitation for the crop growing season, April 1st to October 31st, was 26.79 inches which is 1.04 inches less than normal.

The last killing frost in spring occurred at most stations about March 17th and the first in autumn October 25th or November 5th, the length of the growing season for 90 stations being 231 days which is about 16 days longer than the average. The growing season ranged from 272 days at El Dorado to 195 days at Winslow, a difference of two and a half months between the Ozarks and the southern section of the State. There were 162 clear days during the year, 83 partly cloudy, 120 cloudy, and 98 with 0.01 inch or more precipitation. The prevailing wind was from the south.   W.C.H.

WEATHER BY MONTHS

January.—The temperature during the month was somewhat below normal and the precipitation slightly above. The weather was mostly unfavorable for farm work and outdoor pursuits, frequent rains and thawing and freezing weather keeping the soil too wet for plowing. Heavy rains the latter part of the month caused flood stages in the smaller streams of the State.

February.—This was the coldest February in Arkansas since 1905, the monthly mean being below normal at all stations. Zero or lower was reported at 16 stations, 20° below at Lead Hill on the 10th being the lowest for the State. Precipitation was slightly above normal with snowfall unusually heavy, the average for 69 stations being 11.9 inches. Heavy precipitation the latter part of this month caused flood stages in the smaller streams and moderately high stages in the Arkansas and White rivers. The snow cover was favorable for winter grains, meadows, and pastures.

March.—Unusually warm weather prevailed during March, the highest March temperatures on record being reported in most sections of the State on the 24th, 98° at Harrison on that date being the highest recorded. Daily means were below normal during the first decade, but thereafter they were almost uniformly above. Rainfall was slightly below normal. There were frequent showers, but the daily amounts were mostly light. Truck, gardens, fruit, and strawberries made excellent progress and early berries were blooming at the close of the month. The last killing frost of the spring occurred in most localities on the 10th or 17th.

April.—The outstanding features of the weather in Arkansas during April were the positive temperature and precipitation departures and the destructive storms on the 10th, 14th, 20th, and 21st. The number of rainy days was considerably above normal in some sections of the State, several stations reporting 12 to 18 days. Heavy rains kept all streams at moderately high stages most of the month, the Black being above flood stage practically the entire month. The Arkansas and the White exceeded flood stages at a few points, but the loss was not large, little farm work having been done and no crops planted.

May.—The mean temperature for the month was 1.4° below normal, the average precipitation 1.29 inches above normal. The weather was mostly cloudy and showery, rain being reported in the State every day except the 21st and 22d. Seven stations reported monthly totals exceeding ten inches. Moderately high stages prevailed in most streams during the closing days of April and the rains of May caused flood stages in the principal streams of the State. Highway No. 70 to Memphis was inundated most of the month, necessitating long and difficult detours. The flood loss was estimated at $970,000. The weather of the month was mostly unfavorable for farm work, being too cool for growth and too wet for cultivation. Stands of corn and cotton were poor in many localities and at the close of the month all crops were badly in need of cultivation.

June.—The weather during June was cool and dry except in northwestern counties where the rainfall was heavy. Conditions were mostly favorable for crops in the northern half of the State, but it was too dry for corn in many localities in southern counties. Cotton made good progress and chopping was practically completed during the month, fields being clean in most localities, but stands were irregular. Corn was hurt by the dry weather in southern and southeastern sections of the State, but elsewhere the crop made excellent progress.

July.—High day temperatures, cool nights, daily means almost uniformly above normal, abundant sunshine, and slightly deficient precipitation were the distinguishing characteristics of the weather during July. The weather of the month was mostly favorable for the growth and cultivation of all crops except that it was too dry for corn locally in southern and central sections of the State.

August.—Temperatures were somewhat above and precipitation considerably below normal during August, this being, with one exception, the driest August on record in Arkansas. The average precipitation for 88 stations was 1.29 inches. The least August precipitation on record for the State is 1.27 inches in August, 1909. The weather of the month was favorable for the cultivation, but too dry for the growth of most crops. Cotton picking and ginning started the last of the month in southern and central counties.

September.—The month was marked by temperature and precipitation below normal, but no extremes approached the records of previous years. Precipitation was heavier in western sections of the State, least in the Arkansas and White River valleys. The weather was favorable for picking and ginning cotton. Corn was practically matured by September 30th.

October.—The temperature for the State was normal during October while the average precipitation was 1.32 inches above normal. Freezing temperatures and heavy to killing frosts were reported over the greater part of the State on the 24th and 25th. The month was dry until the last three or four days when heavy to excessive rains occurred in numerous localities. The rainfall was excessive at Little Rock on the 30th, previous intensity records for October being broken. The weather as a whole was favorable for harvesting and all fall farm activities.

November.—The outstanding features of the weather during November were the negative temperature and precipitation departures and the heavy snowfall. This was the coldest November in Arkansas since records have been kept, the mean temperature for 61 stations being 5.5° below the November normal. Killing frost occurred in practically all remaining localities on the 5th. The average snowfall for 65 stations was 3.2 inches, 8.0 inches being measured at Clarendon, Dumas, and El Dorado. The snowfall was heaviest in the southern half of the State. This is the greatest November snowfall on record. The weather was unfavorable for farm activities.

December.—The temperature averaged 1.9° above normal, the precipitation 0.21 inch below normal. Unusually warm weather prevailed from the 10th to the 17th while a severe cold wave from the 18th to the 24th brought zero temperatures in the northwestern counties. Unusually heavy snowfall occurred in southern counties on the 21st and 22d, El Dorado reporting 18.2 inches, the heaviest on record. The average snowfall for 65 stations was 3.7 inches.

The departures from normal temperature and precipitation are computed only for stations having ten or more years record, but all complete reports are used in determining section means. T., less than 0.01 inch rain or melted snow. Reference letters [a], [b], [c], appearing in the table indicate number of days missing: for example, [b] represents two days missing. † Also on later dates. ‡‡ Post-office addresses of these stations as follows:- Index, Route A, Texarkana, Ark., Lutherville, R. F. D. No. 1, Lamar, Ark. Springbank, Doddridge, Ark. *31 days missing. ‡32 days missing.

VOL. XXXV LITTLE ROCK, ARK., JANUARY, 1930 No. 1

GENERAL SUMMARY

The opening month of 1930 brought to Arkansas the coldest weather experienced in this section since January, 1918, and, with the exception of January 1916, the heaviest total precipitation for any winter month in Arkansas' Climatolcgical History. A severe cold wave overspread the State about the middle of the month and thereafter temperatures were almost unifomly below normal, 28° below zero at Lead Hill on the 22d being within 1° of the lowest temperature on record in Arkansas. Temperatures of zero or lower were recorded at all stations from the 18th to the 22d except at Crossett.

The month opened with temperatures 15° above normal and the daily means were near or somewhat above during the remainder of the first week. Moderately cold weather prevailed from the 8th to the 11th, but temperatures were again normal or above from the 12th to the 14th, cold weather prevailing the remainder of the month. The mean temperature, as determined from the records of 57 stations, was 33.8° which is 7.3° below normal, all stations for which normals have been computed having negative departures. Monthly means ranged from 42.8° at Portland to 25.2° at Bentonville, a difference of 17.6° between southeastern and northwestern sections of the State. The highest temperature recorded during the month was 74° at Dumas, Hope, and Portland on the 1st. The highest occurred in all sections at the opening of the month, the lowest in most localities on the 18th.

The average precipitation for 89 stations was 9.16 inches which is 5.06 inches above normal, all stations except Booneville and Portland reporting monthly totals above normal. Precipitation was heavy to excessive from the 7th to the 14th, numerous stations reporting precipitation every day during this period. Sleet and snow were reported throughout the State, the average snowfall being 5.0 inches. Cotter reported 18 inches of snow during the month, numerous northern stations reporting 8 to 12 inches. Gravette, Benton County, reported snow on the ground from the 8th until the close of the month. The monthly total precipitation ranged from 16.31 inches at Arkadelphia to 3.21 inches at Ozark. The greatest amount for any 24-hour period was 6.15 inches at El Dorado on the 8th. The average number of days with 0.01 inch or more precipitation was 12. This number has been equalled, but not exceeded during January.

The weather for the month as a whole was unfavorable for all outdoor activities and but little work was done. Glaze and sleet did some damage in northwestern portions of the State and peaches and apples were damaged, but it is as yet too early to determine accurately the extent. The snow cover was favorable for wheat, meadows, and pastures, but the low temperatures killed oats in most portions of the State. W.C.H.

VOL. XXXV LITTLE ROCK, ARK., FEBRUARY, 1930 No. 2

GENERAL SUMMARY

The continued cold weather of January was followed by the warmest February on record in Arkansas. Temperatures were near or slightly below normal in most sections of the State for about three days near the middle of the month, otherwise uniformly above normal with positive departures of 15° to 25° from the 18th to the 25th. There were were no cold waves during the month, no snowfall reported, and all stations for which normals have been computed showed positive temperature departures. Maximum temperatures were not unusually high, the extreme of 86° having frequently been exceeded, but the lowest for the month, 16°, is an unusually high minimum. The mean temperature for the month, as determined from the records of 61 stations, was 52.2° which is 9.4° above normal. Monthly means ranged from 46.6° at Batesville to 56.2° at Portland, a difference of 9.6° between northern and southeastern sections of the State. The coldest weather of the month occurred in most localities about the 16th, the warmest about the 22d or 23d. The average precipitation for 91 stations was 3.92 inches which is 0.57 inch above normal. Monthly totals were slightly above normal at most stations, but in scattered localities negative departures occurred. Monthly totals ranged from 6.18 inches at Springbank to 1.60 inches at Mena. Most of the rain fell from the 1st to the 4th, 13th to 15th, and 22d to the 28th, practically none other days. The greatest 24-hour amount was 3.60 inches at Princeton on the 4th. The average number of days with 0.01 inch or more precipitation was 6.

The weather for the month as a whole was favorable for outdoor activities and more than the usual amount of farm work was done. Many showers were not heavy enough to stop plowing more than a day. An increased acreage of oats was sown and by the close of the month gardening and truck planting were started throughout the State. Indications are that the fruit damage in January was not so great as first reported. Peaches were blooming in some sections at the close of the month. No destructive wind storms were reported. The condition of dirt roads improved. Most streams remained at moderately low stages.

ARKANSAS SECTION
HARVEY S. COLE, Meteorologist

VOL. XXXV LITTLE ROCK, ARK., MARCH, 1930 No. 3

GENERAL SUMMARY

The outstanding characteristics of the weather in Arkansas during March, 1930, were the negative temperature and precipitation departures, all stations for which normals have been computed showing negative temperature departures and all except one, negative precipitation departures. Although the means were considerably below normal, extremes did not approach the limits established by previous records. Temperatures were considerably below normal the opening days of the month and during the last week, near or somewhat above over most of the State in the entervening period. Thus far the year 1930 has been characterized by marked temperature fluctuations, January's mean being one of the lowest experienced in this State, February's the highest on record, and again in March the mean temperature was considerably below normal and 1.8° below the mean of the preceding month. The mean temperature for the month, as determined from the records of 62 stations, was 50.4° which is 2.3° below normal. Monthly means ranged from 43.4° at Dutton to 55.2° at Prescott, a difference of 11.8° between northwestern and southern sections of the State. The coldest weather occurred in practically all localities the opening days of the month, but the closing days were almost as cold. The highest occurred about the 15th or 20th. Extremes ranged from 15° at Dutton and Eureka Springs on the 2d to 83° at Harrison on the 20th. The greatest daily range was 53° at Harrison on the 12th.

The average precipitation, as determined from the records of 92 stations, was 2.21 inches which is 2.53 inches below normal, all stations except Wynne showing negative departures. Practically all precipitation fell as rain. A trace of snow occurred over the northern half of the State on the 25th, 6 stations reporting measurable amounts averaging half an inch. Monthly totals ranged from 0.54 inch at Gravette to 7.55 inches at Wynne. Daily amounts were light and scattered throughout the month, but practically none fell after the 25th. The greatest amount measured for any 24 hour period was 2.24 inches at Fayetteville on the 18th. The average number of rainy days was 6.

The opening days of the month were too cold for farm work but much plowing followed until the last week when it was again too cold with the ground frozen in northern sections. Considerable corn was planted during the middle of the month and some was killed by the low temperatures the closing days of the month. A small amount of cotton was planted in southern counties. Strawberries were damaged by the low temperatures. At the close of the month more than the usual amount of farm work had been done. W.C.H.

VOL. XXXV LITTLE ROCK, ARK., APRIL, 1930 No. 4

GENERAL SUMMARY

The outstanding characteristics of the weather in Arkansas during April were the positive temperature and negative precipitation departures. All stations for which normals have been computed recorded temperatures above the April normal and no station measured as much as normal rainfall.

The month opened with temperatures normal or slightly above and daily means continued above the seasonal average in practically all localities until about the 23d when a moderately cool wave occurred with daily means below normal for three or four days. Thereafter temperatures were again slightly above normal. The mean temperature for the month, as determined from the records of 63 stations, was 64.9° which is 3.5° above normal. Monthly means ranged from 58.9° at Dutton to 69.7° at Junction and Prescott, a difference of 10.8° between northwestern and southern sections of the State. The highest temperature recorded during the month was 96° at Harrison on the 10th, the lowest, 27° at Calico Rock on the 1st. The highest occurred in most sections about the 7th or 10th, the lowest on different dates. Extremes were well within the limits established by previous records. The greatest daily range was 56° at Brinkley on the 13th.

The average precipitation for the State, as determined from the records of 93 stations, was 1.41 inches which is 3.47 inches below normal. This was the driest April in Arkansas since State wide records have been kept, 1903 with 1.86 inches being the next driest. Monthly totals ranged from 4.40 inches at Harrison to none at Princeton. There were thirty-three stations reporting monthly totals of less than an inch. Although the average rainfall for the month was the least on record, the number of rainy days was only two below normal. Little rain was recorded from the 5th to the 12th, but during other periods light scattered showers were of daily occurrence. The greatest amount measured for any 24-hour period was 2.15 inches at Harrison on the 23d.

Considered as a whole, the weather in Arkansas during April was unusually favorable for farming and all other outdoor work. Cotton planting started in southern sections of the State during the closing days of March and continued with slight interruptions throughout the month. At the close of the month planting was in progress to the northern counties and cultivation was under way in southern sections. Corn made good progress in practically all sections, but rain was needed at the close of the month. All farm work was well in hand at the close of the month and conditions generally were favorable. W.C.H.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

THUNDERSTORMS:---1st, 3; 2d, 16; 3d, 14; 5th, 12; 6th, 1; 11th, 1; 12th, 1; 13th, 14; 14th, 4; 15th, 8; 16th, 16; 17th, 9; 19th, 1; 20th, 12; 22d, 3; 23d, 10; 24th, 6; 26th, 12; 27th, 5; 28th, 2; 29th, 19; 30th, 7.

SOLAR HALOS:-----4th, 1; 7th, 1; 17th, 1; 22d, 2; 23d, 1; 25th, 1.

DENSE FOG:------3d, 7; 5th, 1; 14th, 3; 20th, 1; 24th, 2; 28th, 1.

Moderate Hail at Saratoga the 17th, slight damage.

VOL. XXXV LITTLE ROCK, ARK., MAY, 1930 No. 5

GENERAL SUMMARY

Monthly precipitation totals thus far this year have shown wide variations. January was, with but one exception, the wettest January in Arkansas since State-wide records began. April was the driest April on record and was followed by May with the greatest total for that month recorded during the past 40 years. There was no rain in the State the first day of the month, but thereafter showers were of daily occurrence in almost all sections until the 18th. Practically no rain fell after the 18th except on the 23d when moderate showers were general. Totals for the 10th and 17th were excessively heavy, four to seven inches being measured at several stations. New excessive records for 10 and 15 minute periods were established at Little Rock on the 10th, 1.01 inches being recorded in 10 minutes and 1.35 inches in 15 minutes. These rains caused flood stages on all the streams of the State. Lowlands were flooded, crops had to be re-planted, and construction work on highways and bridges was halted in some localities. Highway No. 70 was closed near Brasfield.

The average precipitation for the State, as determined from the records of 91 stations, was 10.06 inches which is 5.04 inches above normal, all stations except Rogers showing positive departures. Monthly totals ranged from 18.51 inches at Hot Springs to 3.86 inches at Corning (river). There were 47 stations reporting monthly totals exceeding 10 inches. The greatest amount for any 24-hour period was 7.85 inches, measured at Index on the morning of the 18th. Despite the fact that the monthly total is the largest on record for May, the number of clear days was one more than normal, the number of rainy days only four above normal, and the percentage of possible sunshine was practically normal.

The mean temperature, as determined from the records of 62 stations, was 68.8° which is 0.2° below normal. Eighteen stations, principally in the southern half of the State, showed positive departures. Negative departures were recorded at all others. Monthly means ranged from 62.4° at Winslow to 72.8° at Portland, a difference of 10.4° between northwestern and southeastern sections of the State. The highest temperature recorded was 95° at Dumas on the 27th. The lowest temperature was 34° at Dutton on the 31st. The lowest occurred in most sections the last of the month, but the highest occurred the opening days in many localities. The greatest daily range was 41° at Harrison and Lead Hill on the 31st.

Cotton planting was completed in the southern part of the State early in the month and by the middle of the month most of the crop had been planted, but the excessively heavy rains of the 10th and 17th beat the ground until that which had not come up had to be re-planted. In many localities land was badly washed and the crop submerged so abandoning or replanting was necessary. The weather was too cool for cotton to grow rapidly and at the close of the month the plants were small and fields grassy, but cultivation was under way. Corn made very good progress and was in good condition except where flooded.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

THUNDERSTORMS:---1st, 1; 2d, 34; 3d, 29; 4th, 23; 5th, 14; 6th, 35; 7th, 22; 8th, 32; 9th, 49; 10th, 56; 11th, 9; 12th, 3; 13th, 16; 14th, 2; 15th, 30; 16th, 29; 17th, 39; 18th, 37; 19th, 13; 22d, 7; 23d, 24; 24th, 1; 25th, 1; 26th, 1; 27th, 1; 28th, 1; 29th, 9; 30th, 1.

LUNAR HALOS:-----5th, 1; 6th, 1; 15th, 1.

SOLAR HALOS:-----1st, 1; 9th, 1; 14th, 1; 15th, 1; 28th, 1.

DENSE FOGS:-----15th, 1; 19th, 1; 20th, 1; 26th, 1.

Heavy Hail 18th at Helena, slight damage.

Moderate Hail 29th at Thornburg, slight damage.

Straight Winds: Higden 7th, damage to barns and small buildings. Booneville 10th, damage estimated $1,000.

Tornadoes: Marion 18th, sw to ne, destructive path 1-4 mile, killed 4, injured 8, property damage $7,500.
Starting near Tichnor moving northeastward near Lambrook, Elaine, and Wabash, killed 14, injured 34, property damage $14,500.

VOL. XXXV LITTLE ROCK, ARK., JUNE, 1930 No. 6

GENERAL SUMMARY

The outstanding characteristic of the weather in Arkansas during June, 1930, was the unusually light rainfall, this being the driest June of the past 40 years. Precipitation totals for the various months of this year continue to show wide variations. January was next to the wettest January on record, April was the driest April, May the wettest May, and was followed by the driest June. The excessively heavy rains of January and May built up large positive precipitation departures which have not yet been overcome by the dry months, but these departures do not reflect the true soil condition in Arkansas, the excessive rain having run off, the close of June finding the soil unusually dry except in a few counties in the northwestern section of the State where normal rainfall occurred. The average precipitation, as determined from the records of 90 stations, was 0.87 inch which is 3.15 inches below normal, all stations except Gravette and Bentonville showing negative departures. Monthly totals ranged from none at Mammoth Spring to 6.20 inches at Gravette. Only twenty two stations recorded monthly totals exceeding an inch and in many localities showers were scarcely sufficient to lay the dust. The greatest amount for any 24 hour period was 3.00 inches at Marshall on the 20th. The average number of rainy days was 2.

The mean temperature for the State, as determined from the records of 60 stations, was 76.4° which is 0.7° below normal. Monthly means ranged from 68.6° at Dutton to 80.0° at Prescott, a difference of 11.4° between the Ozarks in the Northwest and the southern section of the State. The highest temperature recorded was 107° at Magnolia on the 26th, the lowest, 39° at Lead Hill on the 1st and at Dutton on the 7th. Extremes occurred on approximately these dates throughout the State.

The dry weather was favorable for the cultivation of all crops and fields were clean and crops well cultivated in all localities, but it was entirely too dry for corn except in a few northwestern counties. At the close of the month corn was being damaged throughout southern and eastern sections of the State. Cotton made slow growth, but was blooming and in fairly good condition at the close of the month. Rice was deteriorating and all minor crops needed rain. The streams of the State remained at low stages throughout the month except for a moderate rise in the Arkansas about the middle of the month due to heavy rains in Oklahoma. Dirt roads were dry and dusty.

VOL. XXXV LITTLE ROCK, ARK., JULY, 1930 No. 7

GENERAL SUMMARY

June, 1930, with an average rainfall of 0.87 inch, was the driest June of the past 40 years and was in turn followed by an even drier July when the rainfall of 91 stations averaged only 0.74 inch. Not only was July the driest on record in Arkansas, but it was also the warmest, exceeding the previous warm July of 1901 by 1.0°. In many localities the average daily maximum temperatures for the month exceeded 100° and the extreme of 115° at Hope, Rison, and Subiaco on the 29th is within 1.0° of the absolute highest ever recorded in Arkansas. Many stations recorded the highest for all time, 107.7° at Little Rock being 1.8° higher than ever before registered. Mammoth Spring reported no rain during June and only a trace during July while at Little Rock no rain of consequence occurred after the 23d day of May. Many other localities were equally dry. The unprecedented and prolonged hot, dry weather virtually destroyed crops in many localities in the hill sections of the State and even the lowland crops were badly damaged. Cotton was still small at the close of the month and in many localities was blooming in the top. Most early corn was damaged beyond recovery, but late corn will still make if rain occurs. The acreage of abandoned rice, due to water shortage, is the largest ever reported. Melons, truck, and all smaller crops were badly damaged. In many localities abundant rains would do no good except lay the dust and permit the planting of fall crops. The loss to growing crops in Arkansas cannot be accurately determined, but this is the most disastrous drought on record and no relief has occurred up to the close of the month.

The mean temperature for the State, as determined from the records of 63 stations was 84.7° which is 4.7° above normal, all stations for which normals have been computed showing positive departures. Monthly means ranged from 77.3° at Dutton to 88.2° at Center Point, a difference of 10.9° between northwestern and southern sections of the State. The highest temperature recorded was 115° at several stations on the 29th, the lowest 42° at Dutton on the 16th. The greatest daily range was 52° at Lead Hill on the 17th. Rainfall was light and scattered throughout the month, the only showers of consequence occurring the 23d and 24th. Rainfall was heaviest in northwestern counties, Marshall, Searcy County, measuring 3.80 inches which was the heaviest recorded. Only about 25% of the stations reported monthly totals reaching 1.00 inch. The greatest amount for any 24-hour period was 2.89 inches at Freeman Springs on the 23d. The average number of days with 0.01 inch or more was 2. All streams remained at low stages throughout the month. W.C.H.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

THUNDERSTORMS:---1st, 25; 2d, 4; 3d, 7; 4th, 8; 5th, 3; 6th, 1; 7th, 27; 8th, 34; 9th, 25: 10th, 10; 11th, 7; 12th, 8; 13th, 3; 14th, 3; 15th, 1; 18th, 1; 20th, 1; 21st, 7; 22d, 34; 23d, 32; 24th, 36; 25th, 19; 26th, 4; 27th, 1; 28th, 2; 29th, 2; 30th, 5; 31st, 14.

LUNAR HALOS:-----1t, 1; 2d, 1; 4th, 1; 10th, 1; 12th, 1; 30th, 1; 31st, 1.

VOL. XXXV   LITTLE ROCK, ARK., AUGUST, 1930   No. 8

GENERAL SUMMARY

The hot weather of the preceding month with maximum temperatures of 100° and higher continued to about the 10th of August in most northern and northeastern sections but in southern and western portions of the State and especially where no appreciable amount of rain fell the first half of the month there was no relief from the high temperatures until about the 20th. The mean temperature of 81.8° has been exceeded many times but the maximum of 114° recorded at both Newport and Conway on the 9th is within one degree of the highest on record for August which was established at Searcy in 1918. Showers occurred at about two-thirds of the stations on the 4th or 5th and again on the 30th and 31st but were more general during the second decade with the greatest amount falling on the 16th, 17th, or 18th, some stations reporting from two to four inches during this period. Some counties in central, northeastern, and western sections had no relief from the drought even at the close of the month and during the past 100 days the total precipitation in these areas was less than two inches. Only thirteen stations for which normals have been computed showed positive departures for August, eight in the Ozarks and the north-central portion and five in the southwestern.

The continued dry weather of June and July had nearly destroyed corn, cotton, and other crops in much of the uplands and, though locally heavy showers occurred in most sections of the State from the 10th to the 20th relieving the drought, the high temperatures of the first half of the month had damaged crops beyond recovery in many sections, resulting in the lowest yield of corn per acre for the past 33 years and next to the lowest yield of cotton for the same period. Many fields of corn were cut while still green but others dried up resulting in a total loss. Hay crops improved in northern and north-central portions after the rains and at the close of the month late potatoes, truck, and fall crops were being planted.

The mean temperature for the State, as determined by the records of 63 stations, was 81.8° which is 2.1° above normal; all stations except two for which normals have been computed showing positive departures. Monthly means ranged from 75.0° at Dutton to 86.0° at Center Point. The highest temperature recorded was 114° at both Conway and Newport on the 9th, the lowest 46° at Dutton on the 26th. The greatest daily range was 48° at Marshall on the 26th.

The average rainfall for the 92 stations reporting was 2.58 inches which is 1.11 inches below normal. Monthly totals ranged from 0.23 inch at Blytheville to 7.93 inches at Searcy, 16 stations reporting totals of less than one inch and 28 stations from one to two inches. The greatest amount measured in any 24-hour period was 6.20 inches at Princeton on the 31st. The average number of days with 0.01 inch or more precipitation was 5.

VOL. XXXV   LITTLE ROCK, ARK., SEPTEMBER, 1930   No. 9

GENERAL SUMMARY

Temperatures averaged above normal the first half of September and were again above from the 17th to the 25th with maxima occurring at most stations during the first decade. The latter part of the month was cool, the minimum temperature being recorded on the 27th at nearly all stations, and Dutton, Story, and Winslow reporting light frost on that date. Showers occurred at many stations the first week of the month, but were more general from the 8th to the 15th and later from the 23d to the 26th. On the night of the 14-15th high winds accompanied by rain were reported throughout the State with destructive windstorms striking at Fort Smith and Hot Springs. Damage by wind was also reported from the vicinity of El Dorado on the 4th and from the northwestern part of the State on the 25th. Two persons were killed by lightning during the month; one at Eureka Springs on the 14th and one at Huttig on the 15th.

The mean temperature for the State, as determined by the records of 61 stations was 75.7° which is 1.5° above normal, all stations except six for which normals have been computed showing positive departures. Monthly means ranged from 69.8° at Dutton to 79.7° at Hope. The highest temperature recorded was 106° at Hope on the 8th, the lowest 35° at Dutton on the 27th. The greatest daily range was 45° at Brinkley on the 5th.

The average rainfall, based on the reports of 90 stations, was 4.10 inches which is a departure of 0.67 inch above normal. Of the 64 stations with records of 10 years or more, 44 reported positive departures and 20 negative. The greatest amount measured in any 24-hour period was 5.00 inches at Harrison on the 8th. The average number of days with 0.01 inch or more precipitation was 8.

T.A.M.

Corrections for August, 1930

Rainfall: Princeton on 31st should be 1.20: total for month 2 83; departure −0.51. Average for Arkansas for August 2.53, departure −1.16. Greatest in 24 hours 4 97 at Searcy.

Corrections: July, 1930

El Dorado:---Mean should be 87.1: departure +5.6.
Newport:-----Date of lowest temperature should be 16th†.
Subiaco:-----Number of days clear should be 12, partly cloudy 14, cloudy 5

VOL. XXXV LITTLE ROCK, ARK., OCTOBER, 1930 No. 10

GENERAL SUMMARY

Temperatures for the month of October were above normal from the 8th to the 16th, near normal for the first seven days, and considerably below the latter half of the month. Maxima ranging from 82° to 92° occurred at most stations on either the 9th or 10th and the minimum almost invariably on the 31st. The mean temperature of 60.1° is the lowest mean since 1925 and the minimum of 17° at Dutton the lowest minimum since that date when 13° was recorded on the 31st.

Although the rainfall averaged 1.92 inches above normal, the number of rainy days was only one above. Precipitation was general over the State from the 6th to the 8th with nearly all stations reporting excessive rain, and again from the 21st to the 24th and on the 27th and 28th with about 50% of the stations reporting light amounts on the 16th and 17th. Monthly totals ranged from 1.49 inches at Marianna to 8.45 inches at Highland. Negative departures occurred mostly in the Crowley's Ridge area and the largest totals on the watershed of the upper Ouachita River and along the eastern slope of the Ozarks.

The heavy rains of the 6th and 7th and the frequent showers from the 21st to the 28th delayed the picking of cotton but at the close of the month very little remained in the fields except in the lowlands. Corn, where matured, was gathered and rice harvested and being threshed. Staple crops were damaged little by frost, but fall truck which was planted after the end of the drought was damaged in all sections, especially in the northeastern part of the State. Light frost occurred in the northern part of the State on the 18th, heavy to killing frost in much of the same area on the 24th and 25th, and killing frost with freezing temperature on the 31st in nearly all sections except at a few stations in central and southern parts of the State.

The mean temperature for the State, as determined by the records of 61 stations, was 60.1°, which is a departure of 2.1° below normal, all stations except three for which normals have been computed showing negative departures. Monthly means ranged from 53.4° at Dutton to 64.2° at El Dorado, a difference of 10.8° between the Ozarks and the southern part of the State. The highest temperature recorded was 92° at both Highland and Hope on the 10th, the lowest 17° at Dutton on the 31st. The greatest daily range was 44° at Corning on the 3d.

The average rainfall, based on the reports of 91 stations, was 4.89 inches, which is 1.92 inches above normal. Of the 66 stations with records of 10 years or more, 10 reported negative departures and 56 positive. The greatest amount measured in any 24-hour period was 7.03 inches at Jessieville on the 7th. The average number of days with 0.01 inch or more precipitation was 6.

T.A.M.

VOL. XXXV LITTLE ROCK, ARK., NOVEMBER, 1930 No. 11

GENERAL SUMMARY

The cold weather of the latter part of October extended into November bringing freezing temperatures and killing frosts to some sections in southern counties for the first time this fall. The mean temperature of 50.5° with a departure of —1.1° makes the third consecutive November with the average below normal but the month was not near so cold as that of 1929 when the average for the State was 46.1°. Temperatures were generally below normal for the first eight days and again during the last decade but from the 11th to the 20th they were uniformly above with the highest occurring either the 18th or 19th. The lowest for the month occurred at most stations on the 26th, 27th. or 28th but at a few stations during the earlier part of the month.

Showers occurred in most sections of the State either the 2d or 3d and general rains from the 10th to the 16th, the 19th to 21st, and on the 29th and 30th with the greatest amount falling near the middle or close of the month. Two stations in Montgomery County reported over 9 inches of rainfall and 25 others over 5 inches while three stations had less than two inches. The heaviest rainfall occurred in the Ozarks, on the upper watershed of the Ouachita River, and in southern and southwestern counties; the least in central and northeastern sections of the State. Twenty stations reported a trace of snow on the 24th and 3 others a trace of sleet or snow on other dates. There were three tornadoes in the State during the month the details of which appear under miscellaneous phenomena.

The mean temperature, as determined by the records of 62 stations, was 50.5° which is a departure of 1.1° below normal. Positive departures occurred at six stations, three in the northwestern portion of the State, one in northeastern, and two in central; others were either normal or below. Monthly means ranged from 44.9° at Dutton to 54.6° at El Dorado. The highest temperature recorded was 87° at Pine Bluff on the 18th, the lowest 16° at Dutton on the 6th, and at Thornburg on the 7th. The greatest daily range was 49° at Batesville on the 18th.

The average precipitation for 92 stations was 4.15 inches which is a departure of 0.50 inch above normal. Of the 65 stations for which normals have been computed, 38 showed positive departures and 27 negative with monthly totals ranging from 1.95 inches at Wilson to 9.35 inches at Norman. The greatest amount measured in any 24-hour period was 4.23 inches at Norman on the 15th. The average number of days with 0.01 inch or more precipitation was seven. T.A.M.

VOL. XXXV LITTLE ROCK, ARK., DECEMBER, 1930 No. 12

GENERAL SUMMARY

Although the mean temperature for December was 1.9° below normal, no extremely cold weather was experienced during the month, and the extremes were well within the limits of previous years. Temperatures were uniformly above normal from the 7th to the 13th and averaged near or somewhat above for the first week of the month but were generally below normal the latter half with minima occurring about the 17th or 22d. The highest occurred at most stations on the 9th and at nearly all others during the second week of the month.

Rain was general over the State from the 3d to the 5th and on the 25th or 26th with light precipitation reported at most stations either the 10th or 11th. From the 15th to the 18th precipitation fell in the form of snow at many stations and again at a few stations on the 27th or 28th with 13 reporting a trace for the month and 34 others a measureable amount, the average of which was 2.3 inches. The greatest total snowfall reported was 6.4 inches at Bentonville in the northwestern part of the State while three other stations reported over 5 inches. Sleet fell at some stations on the 15th and 27th but no glaze was reported. The heaviest precipitation occurred in the southern and eastern sections of the State with two stations reporting over 5.00 inches and seven others over 4.00 inches; the least in the upper watershed of the Ouachita River and in the Ozarks and west-central portion of the State with two stations reporting less than 1.00 inch and 27 others less than 2.00 inches.

The mean temperature for the State, as determined by the records of 63 stations, was 40.6° which is a departure of 1.9° below normal. Monthly means ranged from 35.0° at Dutton to 47.2° at Hope with all stations except seven, located principally in the northwestern part of the State, showing negative departures. The highest temperature recorded was 83° at Hope on the 11th, the lowest 9° at Dutton on the 22d, 23d, and 27th. The greatest daily range was 46° at Hope on the 8th.

The average precipitation, based on the reports of 91 stations, was 2.58 inches which is 1.47 inches below normal. Of the 65 stations with records of 10 years or more only 9 reported positive departures; all others negative. Monthly totals ranged from 0.95 inch at Mammoth Spring to 5.31 inches at Warren. The greatest amount measured in any 24-hour period was 2.55 inches at Fort Smith on the 4th and 5th. The average number of days with 0.01 inch or more precipitation was 6.

Vol. XXXV Little Rock, Ark., Year, 1930 No. 13

GENERAL SUMMARY

The year 1930 was marked by extremes in precipitation and temperature. January was the coldest month since 1918 and, with the exception of January 1916, the wettest winter month on record. This extremely cold weather was followed by an unusually warm February which established a new temperature record for that month. The driest April was followed by the wettest May in 40 years and the driest June for the past 40 years was followed by an even drier July and the warmest July on record in the State. Although no temperature nor precipitation records for the State, as a whole, were broken in August, the maximum temperature of 114° is within 1° of the absolute highest for the month and the total rainfall for many stations in central and western sections was seriously deficient.

The mean temperature for the year was 61.7° which is 0.5° above normal. Positive departures occurred at 34 stations for which normals have been computed and negative at 15 others. Monthly means were below normal in January, March, May, June, October, November, and December; above the other months. Annual means ranged from 55.2° at Dutton to 65.7° at Hope. Extremes ranged from 28° below zero at Lead Hill on January 22d to 115° at Hope, Rison, and Subiaco on July 29th.

The average precipitation for the State was 46.62 inches which is 1.10 inches below normal. Of the 62 stations with records of 10 years or more and with unbroken annual records for the year, 28 showed positive departures and 34 negative. Precipitation was heaviest in January and May and the amounts for these two months accounted for over 50% of the yearly total at several stations and for over 40% of the yearly total for the State as a whole. Rainfall was the least on record for June and July with Mammoth Spring recording only a trace for these two months, Arkadelphia only 0.05 inch, and several other stations less than 0.25 inch. Showers in August broke the drought in most sections but in some central, northeastern, and western counties there was no relief until in September.

The last killing frost in spring occurred at most stations from March 29th to 31st and the first killing in autumn about October 24th in the northern part of the State and on October 31st in nearly all other sections. Staple crops were damaged little by the frost in the fall but truck which was planted after the end of the drought was damaged in all sections, especially in the northeastern part of the State.

Tornadoes occurred in March, May, and November in which 19 persons were killed, 59 injured, and property valued at $289,400 was destroyed. For details of damage from tornadoes and windstorms, see tabulated data, page 55. T.A.M.

WEATHER BY MONTHS

January:—This was the coldest January since 1918. A severe cold wave overspread the State about the middle of the month bringing temperatures of zero and lower even to the southern border counties. The minimum temperature of 28° below zero at Lead Hill is within 1° of the lowest ever recorded in Arkansas. Temperatures were again below zero in many sections from the 22d to the 24th. Precipitation was heavy to excessive from the 7th to the 14th with many stations reporting from 4.00 inches to 6.00 inches on the 8th, and the number of rainy days, 12, equals the record for the month. Snowfall was heavy especially in the northern part of the State, Cotter reporting a monthly total of 18 inches.

February:—The weather during the month was a decided contrast to that of the preceding month. There were no cold waves nor snow and, with a mean temperature of 52.2°, this was the warmest February on record in Arkansas. Although the precipitation was slightly above normal, more than the usual amount of farm work was done and by the close of the month gardening and the planting of truck were started throughout the State.

March:—The temperature for March averaged 2.3° below normal and precipitation 2.53 inches below. Daily amounts were light and scattered throughout the month with practically none falling after the 25th. Farm work was farther advanced than usual and considerable corn was planted during the middle of the month, but the closing days brought killing frosts to most of the State which resulted in damage to corn and strawberries.

April:—The average precipitation for the State was 1.41 inches which is 3.47 inches below normal, making this the driest April in Arkansas since State wide records have been kept, 1903 with an average of 1.86 inches being the next driest. The average temperature was above normal and the month, as a whole, was unusually favorable for farm work. Cotton planting began the closing days of March in southern counties and at the close of the month was in progress even in the northern part of the State. Corn made good progress in nearly all sections, but rain was needed by the close of the month.

May:—Showers were of daily occurrence in almost all sections from the 2d to the 18th with excessively heavy rains on the 10th and 17th, four to seven inches being measured at several stations. Lowlands were flooded and in many localities land badly washed. Cotton which had not come up had to be replanted even where not submerged. The weather was too cool for cotton to grow rapidly and at the close of the month the plants were small and the fields grassy. Corn made very good progress and was in good condition except where flooded.

June:—The average precipitation for the State was 0.87 inch which is 3.15 inches below normal, this being the driest June of the past 40 years. Only 23 of the 91 stations reporting had monthly totals exceeding an inch and 21 stations had less than 0.25 inch. The dry weather was favorable for the cultivation of all crops, but it was entirely too dry for corn except in a few northwestern counties and at the close of the month it was being damaged throughout southern and eastern sections. Cotton was blooming and in fairly good condition but all crops needed rain badly by the end of the month.

July:—New temperature records were established in July. Not only was this the warmest July on record in Arkansas, but it was also the driest. In many localities the average daily maximum temperature for the month exceeded 100° and the extreme of 115° at Hope, Rison, and Subiaco on the 29th is within 1° of the highest ever recorded in Arkansas. The average precipitation for the State was 0.74 inch which is 3.08 inches below normal. Rainfall was light and scattered throughout the month with the heaviest occurring in the northwestern counties. Twenty nine stations had monthly totals of less than 0.25 inch. The long period of hot, dry weather virtually destroyed crops in many localities in the hill sections of the State and even in the lowlands crops were badly damaged. Most early corn was damaged beyond recovery and at the close of the month cotton was still small and blooming in the top in many localities.

August:—The hot, dry weather of the preceding month continued until the 10th in most northern and northeastern sections of the State, but in southern and western portions there was no relief from the high temperatures until about the 20th. Showers were fairly general during the second decade of the month, but some counties in central, northeastern, and western sections of the State had no relief from the drought even at the close of the month, and during the past 100 days the total precipitation in these areas was less than 2.00 inches. Corn, cotton, and other crops in much of the uplands were virtually destroyed and in all other sections were seriously damaged.

September:—The temperature averaged 1.5° above normal and precipitation 0.67 inch above, but the latter part of the month was cool. Light frost occurred at three stations in the northwestern part of the State on the 27th but no damage was reported. On the night of the 14-15th high winds accompanied by rain were reported throughout the State with Ft. Smith reporting a loss estimated at $100,000.

October:—The mean temperature of 60.1° is the lowest mean for October since 1925. Extremes ranged from 17° at Dutton to 92° at Highland and Hope on the 10th. Precipitation was 1.92 inches above normal and the number of rainy days one above. The heavy rains of the 6th and 7th and the frequent showers from the 21st to the 28th delayed the picking of cotton, but at the close of the month little remained in the fields except in the lowlands. Corn, where matured, was gathered and rice harvested and being threshed.

November:—The opening days of the month were cool with freezing temperatures and killing frosts occurring in southern counties for the first time this fall. The mean temperature of 50.5° with a departure of —1.1° makes the third consecutive November with the average below normal. Precipitation was 0.50 inch above normal with 38 stations showing positive departures and 27 negative.

December:—No extremely cold weather was experienced during the month and the extremes were well within the limits of previous years. Precipitation averaged 2.58 inches which is 1.47 inches below normal. Snow fell at a number of stations from the 15th to the 18th with 34 stations reporting an average of 2.3 inches. The heaviest precipitation occurred in southern and eastern sections of the State; the least in the upper watershed of the Ouachita River and in the Ozarks and the west-central portion of the State.

The departures from normal temperature and precipitation are computed only for stations having ten or more years record, but all complete reports are used in determining section means. T., less than 0.01 inch rain or melted snow. Reference letters ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing: for example, ^{b} represents two days missing. † Also on later dates. ‡‡ Post-office addresses of these stations as follows:-Freeman Springs, Dover, Ark., Index, Route 5, Texarkana, Ark., Lutherville, R. F. D. No. 1, Lamar, Ark. Springbank, Doddridge, Ark. *Also in July.

Monthly and Annual Mean Temperatures for the Year 1930, with Departures from the Normal

CORRECTIONS FOR YEAR 1930

Precipitation departures should be: Center Point, April −2.32 inches; Fayetteville, June −0.72; Fort Smith, July −2.18; Hot Springs, February +1.89; Springbank, July −3.31; Subiaco, July −2.16; Waldron, July −2.27. Waters, May total precipitation should be 12.85. Conway, June temperature departure should be −1.4°. Corning, January minima should be: 18th, −16°; 19th, −5°; 22d, −5°; 23d, −8°; mean minimum temperature 21.1°; mean temperature 29.4°; departure −7.9°. Dumas, March, minimum temperature for 31st should be 34°; mean minimum temperature 42.0°; mean temperature 53.9°; departure −3.5°. Fort Smith, February mean temperature should be 53.0°; departure +10.2; March, date of lowest should be 3d; April, number of rainy days should be 10; May temperature departure should be −0.8°; September, percentage of possible sunshine should be 69. Lutherville, June temperature departure should be +0.8°. Mammoth Spring, November, number partly cloudy days should be 2, cloudy 9. Warren, February temperature departure should be +10.1°.

VOL. XXXVI LITTLE ROCK, ARK., JANUARY, 1931 No. 1

GENERAL SUMMARY

January 1931 with a mean temperature of 42.3° and with only one station reporting a minimum temperature of zero was quite a contrast to January 1930 when the mean was 33.8° and the minimum 28° below zero. Precipitation was below normal, this being the third driest January on record, January 1893 with an average of 1.13 inches and January 1911 with 1.02 inches being drier.

The mean temperature for the State, as determined by the records of 63 stations, was 42.3° which is a departure of 1.3° above normal. Monthly means ranged from 36.6° at Dutton to 48.6° at Hope, and of the 55 stations for which normals have been computed, 49 showed positive departures, 5 negative, and one exactly normal. Positive departures were especially noticeable in the northern and northwestern portions of the State, all stations except one with negative departures being located in southern counties. Temperatures were above normal for the first five days in nearly all sections but from the 6th to the 20th were near or below with the coldest occurring at all stations either the 14th or 15th. From the 21st to the 31st temperatures were uniformly above normal with maxima occurring in all sections during the last week of the month. The highest temperature recorded was 76° at Calico Rock on the 30th and at three other stations during the latter part of the month; the lowest 0° at Corning on the 15th. The greatest daily range was 51° at both Calico Rock and Mount Ida on the 30th.

The average precipitation, based on the reports of 92 stations, was 1.14 inches which is 3.10 inches below normal, all stations with records of 10 years or more showing negative departures. Monthly totals ranged from a trace at Harrison to 3.40 inches at El Dorado, and 47 stations had totals of less than one inch. Rain occurred from the 4th to the 8th with an inch or more reported in southern counties either the 4th or 5th and snow at a few stations in the northern part of the State on the 7th. Precipitation was mostly light and scattered from the 11th to the 18th with 34 stations reporting a measurable amount of snow on the 13th, the average of which was 1.2 inches. The only rain falling after the 19th was that of the 26th or 27th which was generally less than 0.25 of an inch. The heaviest precipitation occurred in southern and eastern sections; the least in the upper basin of the Ouachita River and in the west-central and northwestern portions of the State. The greatest amount measured in any 24-hour period was 2.30 inches at El Dorado on the 5th. T.A.M.

Vol. XXXVI Little Rock, Ark., February, 1931 No. 2

GENERAL SUMMARY

Except for February 1929, only once during the past seven years has the mean temperature for February been below normal. February 1930 with a mean of 52.2° established a new high record for the month and, although only moderately cold weather was experienced during February 1931, the mean was not near so high as that of the preceding year. Precipitation was above normal, this being the third consecutive year with a positive departure for the month of February.

The mild weather of the latter part of January continued during the first eight days of February with departures averaging about 12° above normal, but a moderately cold spell overspread the State on the 10th bringing the lowest temperatures for the month at many stations. Temperatures were again below normal from the 14th to the 17th but thereafter they were continuously above. The mean temperature for the State, as determined by the records of 63 stations, was 48.2° which is 4.9° above normal, all stations for which normals have been computed showing positive departures. The greatest departures from the normal occurred in the northwestern portion of the State. Monthly means ranged from 41.0° at Harrison to 53.3° at El Dorado. The highest temperature recorded was 75° at Hope on the 3d and at three other stations on later dates; the lowest 14° at Dutton on the 10th. The greatest daily range was 45° recorded at Crossett on the 12th and at Marked Tree on the 6th.

The average precipitation for the State, based on the reports of 93 stations, was 4.77 inches which is 1.47 inches above normal. Of the stations with records of 10 years or more, 55 showed positive departures and 13 negative. Precipitation was general from the 6th to the 9th with many stations reporting from two to over four inches during this period. Rain again fell on the 12th and 13th, the 16th and 17th, and more scatteringly from the 22d to the 25th and on the 28th. A trace of snow was reported from Lurton on the 8th and from Thornburg and Winslow on the 11th, and one inch from Lurton on the 17th. Monthly totals ranged from 2.52 inches at Junction near the southern border to 8.04 inches at Dutton in the northwestern part of the State. The greatest amount measured in any 24-hour period was 4.46 inches at Dutton on the 8th.

Farm work advanced rapidly during the first week of February. Oats were sown and potatoes, truck, and gardens planted in nearly all sections. Very little work was done during the middle of the month due to frequent rains, but by the close of the month much land had been prepared and some corn planted in extreme southern counties. Fruit buds were much farther advanced than usual and peaches and plums were blooming in central and southern counties.

VOL. XXXVI LITTLE ROCK, ARK., MARCH, 1931 No. 3

GENERAL SUMMARY

March 1931, with a mean temperature of 47.5° and a departure of 5.1°, is the coldest March since 1924 and the first month this year with the mean temperature below normal. The mean for March this year was 0.7° below that of the preceding month. Precipitation was 0.47 inch below normal, thus making the accumulated deficiency for the first three months of this year 2.10 inches.

Although, minimum temperatures during the month were not unusually low, the daily average exceeded the normal for only 8 days at both Fort Smith and Little Rock and for only 4 days at Memphis. Freezing temperatures overspread the State the first of the month with sleet and snow at many stations from the 2d to the 4th. The coldest weather occurred about the 10th in nearly all sections with a measurable amount of snow at many stations in the northern and northwestern portions of the State. Cold weather again overspread the State the latter part of the month bringing sub-freezing temperatures to western and central sections with Winslow in the Ozarks reporting a temperature of 20°. Monthly means ranged from 40.8° at Dutton to 52.8° at Junction near the southern border with all stations for which normals have been computed showing negative departures. The highest temperature recorded was 85° at Okay on the 13th; the lowest 16° at Dutton on the 10th. The greatest daily range was 46° at Thornburg the 10th.

Precipitation was frequent during the first seven days of the month with heavy rains at most stations either the 6th or 7th. Rain again was general from the 20th to the 22d, from the 26th to the 28th, and on the 31st with light scattered showers either the 14th or 15th. Eighteen stations reported a measurable amount of snow during the month, the average of which was 2.0 inches. The average precipitation for the State, as determined by the records of 94 stations, was 4.21 inches, which is a departure of 0.47 inch below normal. Of the 68 stations with records of 10 years or more, 48 showed negative departures, one exactly normal, and 19 positive. Monthly totals ranged from 2.73 inches at Portland in the southeastern part of the State to 6.83 inches at Wynne in the east-central portion. The greatest amount measured in any 24-hour period was 2.64 inches at Black Rock on the 7th.

The low temperatures during the month retarded the growth of all vegetation which had made rapid progress during February. From the 9th to the 19th the weather was favorable for outdoor pursuits but thereafter the soil was mostly too wet and the temperatures too low. Considerable corn and some cotton had been planted by the close of the month but the soil was so cold and wet that replanting will probably be necessary. Early strawberries were damaged somewhat in the western part of the State by the freezing temperatures the latter part of the month but there was only slight damage to other fruit crops.

VOL. XXXVI   LITTLE ROCK, ARK., APRIL, 1931   No. 4

GENERAL SUMMARY

Temperature and precipitation for April 1931 were both below normal, this being the third month this year with the average precipitation below normal and the second consecutive month with the temperature below. The accumulated deficiency in precipitation for the year is now 4.53 inches.

The cool weather of the latter part of March continued in most sections the first six days of April. From the 7th to the 20th temperatures were uniformly above normal, but thereafter were continuously below with the coldest for the month occurring at many stations on the 22d. The mean temperature for the State, as determined by the records of 62 stations, was 59.1° which is 2.4° below normal, all stations for which normals have been computed showing negative departures. Monthly means ranged from 52.2° at Dutton in the Ozarks to 63.1° at Blytheville in the northeastern part of the State with stations located in western border counties generally showing the greatest departures from the normal. The highest temperature recorded was 92° at Warren on the 18th; the lowest 21° at Dutton on the 6th. The greatest daily range was 50° recorded at both Calico Rock and Thornburg on the 7th.

Although the number of rainy days was one above normal, the average precipitation for the 92 stations reporting was only 2.62 inches which is a departure of 2.43 inches below normal. Rainfall was light and scattered during the first eight days of the month but thereafter showers were frequent with only a day or two interval, the heaviest precipitation occurring during the latter half of the month. The geographical distribution was irregular with nearby stations showing a wide divergence in monthly totals. Of the stations with records of 10 years or more, only three reported positive departures; two in the northwestern part of the State and one in the central portion. Monthly totals ranged from 0.62 inch at Amity to 6.43 inches at Little Rock. The greatest amount measured in any 24-hour period was 3.23 inches at Little Rock on the 30th.

The weather was too cool during the first and latter portions of the month for the growth of most crops. Considerable damage to fruit and early strawberries in western and northwestern sections of the State resulted from the frost and freezing temperatures of the 6th and again from the cold spell of the 22d when freezing temperatures occurred in the western half of the State. Cotton where up and tender vegetables in many sections were also damaged on the 22d and much cotton and corn had to be replanted because of the cold, wet soil. Hailstorms also did considerable damage in western border counties on the 17th and 25th.

T.A.M.

Miscellaneous Phenomena

Dates and number of stations reporting

Heavy Hail:-Near Springdale, 16th, destroyed all crops and fruit over an area of one-half square mile, several thousand dollars damage.
Waldron, 25th. $5,000 damage to fruit, truck, and strawberries.
Lewisville, 25th, slight damage to truck and gardens.
Near Mena, 25th, severe damage to fruit, truck, and gardens.

Tornado: ---6 or 8 miles east of Waldron, 25th, 5 p.m. sw to ne, destructive path 1200 feet, none killed nor injured, timber loss $10,000.

VOL. XXXVI LITTLE ROCK, ARK., MAY, 1931 No. 5

GENERAL SUMMARY

Temperature and precipitation for May 1931 were below normal, this being the coolest May since 1924 when the mean temperature was 64.6°, and the driest since 1926 when the average precipitation was 2.42 inches.

Temperatures were near normal the first four days of the month, but much cooler weather overspread the State on the 6th and 7th bringing freezing temperatures to some western and northwestern stations and light frosts to most of the northern half of the State on the 7th. Temperatures continued below normal until the 15th and were again below from the 19th to the 24th with light frost occurring in extreme northern counties on the 23d. The mean temperature for the State, as determined by the records of 61 stations, was 65.2° which is 3.9° below normal, all stations for which normals have been computed showing negative departures. Monthly means ranged from 58.6° at Dutton to 69.2° at Blytheville. The highest temperature recorded was 96° at Hope on the 27th; the lowest 27° at Dutton on the 7th. The greatest daily range was 45° recorded at Mount Ida on the 14th and at two other stations on later dates.

Although only 6 stations out of 65 with records of 10 years or more reported precipitation above normal, some stations in west-central and northwestern portions of the State reported as many as 12 and 13 rainy days and one 14, though the State average was only 8 which is one below normal. Rain was general over the State on the night of April 30th and May 1st and also on the 5th and 6th, the 19th and 20th, the 25th and 26th, and from the 29th to the 31st with the heaviest occurring either the 19th or 20th or on the 25th or 26th. The average precipitation for the State, based on the reports of 93 stations, was 3.45 inches which is 1.66 inches below normal. Monthly totals ranged from 0.74 inch at Hope to 6.18 inches at Danville with stations in the Ozarks, the east-central, and west-central portions receiving the heaviest rainfall and those in the Ouachita and St. Francis river basins and in counties in the southeastern portion the least. The greatest amount measured in any 24-hour period was 3.55 inches at Gravette on the 26th. Many stations in western and northwestern counties reported hail on either the 24th or 25th but the damage was confined mostly to areas near Magazine, Morrillton, and Plainview.

The weather was too cool for the growth of cotton during most of the month and considerable replanting was necessary. Chopping began in southern counties about the middle of the month and cultivation was well along in all portions by June 1st. Practically all of the corn crop was planted the first half of the month, but growth was slow and some had to be replanted. Cutworms did considerable damage. Wheat, winter oats, and hay crops yielded much better than usual. T.A.M.

HARVEY S. COLE, Meteorologist

Vol. XXXVI Little Rock, Ark., June, 1931 No. 6

GENERAL SUMMARY

Although the mean temperature for the State was above normal, the minimum of 35° at Dutton on the 1st is the lowest temperature ever recorded for the month of June, being 2° lower than the previous record of 37° established in June, 1917.

Cool weather overspread the State the first of the month and temperatures were again below normal from the 7th to the 9th but thereafter they were continuously above with nearly all stations reporting maximum temperatures above 100° the latter part of the month. The highest temperature recorded was 107° at Amity on the 30th; the lowest 35° at Dutton on the 1st. The mean temperature for the State, as determined by the records of 63 stations, was 78.3° which is 1.4° above normal. Monthly means ranged from 72.0° at Dutton to 81.0° at Blytheville with only 5 stations out of the 63 for which normals have been computed showing negative departures.

The geographical distribution of rainfall during the month was irregular with the most of the precipitation occurring during thunderstorms. On the night of the 6th-7th showers with severe local thunderstorms swept over most of the State, causing considerable damage to fruit and other crops and washing the soil badly in some sections. Hail was reported from Crawford, Van Buren, Lawrence, and Randolph counties. In the vicinity of Imboden and Ravenden in Lawrence and Randolph counties the damage on the above date was estimated at $100,000.

Showers were frequent from the 10th to the 17th but thereafter until the close of the month they fell only scatteringly over about two-thirds of the State with stations in western and northwestern sections and in counties bordering on the Mississippi River from Crittenden County southward receiving very little rain and some stations none after the 17th. Severe local thunderstorms accompanied by some hail occurred in the northeastern part of the State on the 29th, striking Blytheville and Jonesboro and causing considerable damage from wind and water. The average precipitation for the State, based on the reports of 95 stations, was 2.60 inches which is 1.50 inches below normal. Monthly totals ranged from 0.36 inch at Big Lake Outlet in Mississippi County to 6.03 inches at Hot Springs. Twelve stations reported less than an inch and two less than one-half inch. Of the 66 stations with records of 10 years or more, 10 showed positive departures and 56 negative.

An unusually large number of people were killed or injured by lightning during the month. At De Witt one person was killed; at Eureka Springs two injured, one seriously; at Hamburg one killed and two injured, one seriously; at Heber Springs one killed and one injured; at Hope one killed; at Little Rock one injured.

T.A.M.

VOL. XXXVI LITTLE ROCK, ARK., JULY, 1931 No. 7

GENERAL SUMMARY

July, 1931, with a precipitation average of 6.00 inches, is the wettest July since 1905 when the average was 7.60 inches and is quite a contrast to that of 1930 when the State average was only 0.74 inch.

The hot weather of the latter part of June continued unabated for the first four or five days of July and, although the highest temperature recorded was only 106°, probably the greatest number of people died from heat prostrations ever known in Arkansas. Five people died in Jefferson and Lincoln Counties the latter part of June, and four the first part of July; one at Star City on the 1st; one at Morrillton on the 2d; one at Conway and one at Hartley on the 3d. The mean temperature for the State, as determined by the records of 63 stations, was 81.0° which is 0.8° above normal. Of the stations for which normals have been computed, 41 showed positive departures and 11 negative, the negative departures being reported at stations in the eastern half of the State. Monthly means ranged from 75.0° at Dutton to 83.7° at Booneville. The highest temperature recorded was 106° at Hope and Morrillton on the 2d and at Booneville on the 3d; the lowest 48° at Dutton on the 6th.

The average precipitation for the State, based on the reports of 95 stations, was 6.00 inches which is 2.25 inches above normal. Only 9 of the 67 stations with records of 10-years or more reported negative departures. Monthly totals ranged from 2.13 inches at Morrillton to 13.00 inches at Whitecliffs with the least rainfall occurring in the upper basin of the Ouachita river and in the west-central part of the State, and the heaviest in southern and eastern sections. Rainfall was generally light in the western half of the State during the first half of the month but thereafter showers were frequent in nearly all sections. Two stations had 20 rainy days. Thunderstorms were unusually severe, often causing much damage not only from wind but also from lightning and excessive rain, from 2 to 3 inches being reported at numerous stations the first and latter portions of the month.

July is the second month this year in which a large number of people were killed or injured by lightning. On July 1st one person was killed at Blytheville; on the 3d one near Egypt; on the 9th one was killed and one seriously injured at Pottsville; on the 23d one was killed near Congo, one killed near Biscoe, and one seriously injured at Pine Bluff; on the 24th one was killed at Mulberry.

VOL. XXXVI LITTLE ROCK, ARK., AUGUST, 1931 No. 8

GENERAL SUMMARY

During the past 14 years the mean temperature for August has been below normal but three times. In 1920 the departure was —3.0°, in 1927 —3.2°, and in 1931 —3.1°. The precipitation for August 1931 was above normal, this being the wettest August since 1927.

Temperatures were mostly above normal for the first nine days of the month, the highest occurring during this period, but thereafter with the exception of three or four days they were continuously below. The mean temperature for the State, as determined by the records of 61 stations, was 76.7° which is 3.1° below normal. Monthly means ranged from 70.2° at Dutton to 79.8° at El Dorado, all stations for which normals have been computed showing negative departures and only two stations reporting maximum temperatures of 100° or more. The highest temperature recorded was 103° at Booneville on the 8th, the lowest 42° at Dutton on the 12th, the lowest occurring generally on the 12th or 13th.

Precipitation was light in the southern half of the State the first 15 days of the month but excessively heavy in the Ozarks and in northern border counties. Showers were frequent during the latter half of the month and were more evenly distributed, but the northern half of the State again received the greatest amount. The average precipitation for the State, based on the reports of 92 stations, was 4.71 inches which is 0.99 inch above normal. Monthly totals ranged from 1.29 inches at Little Rock to 14.67 inches at Eureka Springs with stations in the west-central portion and in the Ozarks and counties along the border in the northeastern portion of the State receiving the heaviest rainfall and those in central, east-central, and southern sections the least. Four stations had monthly totals of over 10.00 inches but 11 had totals of less than 2.00 inches. The average number of rainy days was 9 though some stations in the northern part of the State had as many as 14 rainy days.

The weather during August was favorable for the growth of all crops. The greater portion of the corn crop had matured by the close of the month and the yield promises to be the best for many years. The frequent showers and the great number of rainy days caused cotton to grow too rank in some portions of the low-lands, but in the uplands and in other portions of the lowlands the prospests are for an unusually good crop. Damage by weevil has been serious in some southeastern and west-central localities. The weather was very favorable for all minor crops and fruit, melons, cantaloupes, and truck crops yielded abundantly.

VOL. XXXVI LITTLE ROCK, ARK., SEPTEMBER, 1931 No. 9

GENERAL SUMMARY

September 1931 was a warm dry month, being the warmest September since 1925 and the driest since 1928. During the past 41 years there have been but three years with a lower precipitation average than the one inch of this year, those years being 1891 with 0.94 inch, 1897 with 0.60 inch, and 1928 with 0.45 inch.

Although the highest temperature for the month was only 102° and only 16 of the 62 stations reported maxima of 100° or higher, this is the fifth warmest September since 1891. With the exception of the 2d and 3d, temperatures were above normal until the 25th of the month, the greatest departures occurring from the 14th to the 25th. Cool weather overspread the State on the 26th bringing a decided drop in temperature, the lowest for the month at all stations occurring from the 27th to the 30th. The mean temperature for the State, as determined by the records of 61 stations, was 78.4° which is 4.2° above normal, all stations for which normals have been computed showing positive departures. Monthly means ranged from 72.0° at Dutton to 81.6° at El Dorado. The highest temperature recorded was 102° at Thornburg on the 15th and also at Calico Rock and Mountain Home on the 17th; the lowest, 34° at Dutton on the 27th and at Thornburg on the 30th. The highest temperature and the greatest departures occurred generally in the west-central and the northern part of the State. The greatest daily range was 51° occurring at Thornburg on the 28th and at Mount Ida on the 30th.

Showers with locally heavy rains in northeastern and southwestern portions were general over the State on the 2d and 3d, but thereafter little or no rain fell in west-central, northwestern, and southeastern sections and only scatteringly in other portions. Magnolia, in Columbia County, had no rain during the month, Portland in another southern border county had only 0.02 inch, and 8 other stations less than 0.25 inch, while about one-third of the stations reported monthly totals of an inch or more. The average precipitation for the State, based on the records of 94 stations, was 1.00 inch which is 2.36 inches below normal. Only two stations, Hope and Whitecliffs in the southwestern portion, reported positive departures. Monthly totals showed wide variation ranging from none at Magnolia to 4.32 inches at Whitecliffs approximately 60 miles away. The greatest amount measured in any 24-hour period was 4.25 inches at Whitecliffs on the 3d.

Although the heavy rains of the 2d and 3d did some damage to cotton, the hot, dry weather thereafter was very favorable both for growth and the maturing of the bolls. Cotton was opening in the southern portion the first week of the month and in central portions by the 15th, and picking and ginning were well along in all sections by the close of the month. The dry weather did considerable damage to late corn, meadows, pastures, and truck crops but was very favorable for curing all hay crops and for ripening rice. The soil was too dry at the close of the month in most sections for fall plowing and seeding.

VOL. XXXVI LITTLE ROCK, ARK., OCTOBER, 1931 No. 10

GENERAL SUMMARY

Unusually warm weather prevailed during October 1931 and, although the highest temperature recorded was only 98°, this is the second warmest October during the past 40 years, the mean temperature being exceeded only by that of October 1897. Temperatures were above normal from the 1st to the 15th and again from the 21st to the 27th while they were slightly below normal from the 16th to the 20th and from 10° to 15° below the latter part of the month. Light frost was reported from northern, central, and eastern sections of the State about the 18th or 19th and heavy to killing frost over most of the same area on the 31st while some sections along the west-central border reported only light frost on the 31st. The mean temperature, as determined by the records of 62 stations, was 67.1°, which is 4.7° above normal, all stations for which normals have been computed showing positive departures. Monthly means ranged from 60.4° at Dutton to 71.4° at El Dorado. The highest temperature recorded was 98° at Dumas on the 10th, the lowest 26° at both Dutton and Mount Ida on the 31st. The greatest daily range was 50° recorded at Camden on the 20th and at Mount Ida on the 1st.

Showers were generally light and scattered during the first 10 days of the month but were general over the State except in the extreme southern portion from the 10th to the 15th. Some stations in the extreme northwestern portion reported from 2.00 inches to over 7.00 inches during this period. Rain again fell in all sections from the 20th to the 28th with several stations reporting an inch or more on the 22d, 23d, and the 28th. The average precipitation, based on the reports of 95 stations, was 2.35 inches which is 0.82 inch below normal. Only 11 of the 67 stations with records of 10 years or more reported positive departures. Monthly totals ranged from 0.65 inch at Wynne in the east-central portion to 10.22 inches at Gravette in the northwestern part of the State. The greatest amount measured in any 24-hour period was 5.09 inches at Gravette on the 12th.

The weather during October was very favorable for cotton and the yield promises to be the best in the history of the State. Although at times picking was delayed by rains, it progressed rapidly and was nearly completed in some southern counties by the close of the month. Meadows, pastures, late corn, and fall truck were damaged by the dry weather and in eastern and southeastern sections the soil was still too dry even at the close of the month for fall plowing and seeding. The harvesting of rice was nearly completed during the month and the yield was excellent. Very little damage resulted from the frosts and freezing temperatures of the 31st as most crops were matured.

Corrections: September, 1931

El Dorado prevailing wind direction should be SE.
Okay monthly mean should be 78.8°.

Correction for October, 1931

Bee Branch mean temperature should be 66.6°; departure +4.4°.

VOL. XXXVI LITTLE ROCK, ARK., NOVEMBER, 1931 No. 11

GENERAL SUMMARY

Though the maximum temperature for November 1931 has been exceeded many times, the mean temperature has been exceeded only by that of November 1909 and equaled only one other time by that of November 1913 when the mean was 57.6°.

The cool weather of the latter part of October continued the first two days of November but thereafter with only a few exceptions temperatures were above normal until the 24th. Departures were as high as 20° in the western part of the State on the 12th and 13th and in the eastern part on the 13th and 15th. Cooler weather overspread the State on the 25th and thereafter temperatures were somewhat below normal. The mean temperature, as determined by the records of 62 stations, was 57.6° which is 6.2° above normal, all stations for which normals have been computed showing positive departures. Several stations in the northern half of the State reported departures of 7.0° or more and Corning in the northeastern portion a departure of 8.5° above. Monthly means ranged from 52.8° at Dutton to 61.4° at El Dorado and Magnolia. The highest temperature recorded was 88° at Grannis on the 3d and at Helena on the 10th, the lowest 18° at Dutton on the 1st. The greatest daily range was 52° recorded at Calico Rock on the 8th.

Practically no rain was recorded in the State until the 10th and then only scatteringly until about the middle of the month, but thereafter showers were frequent with heavy rains occurring on the 20th and during the latter part of the month. The average precipitation, based on the reports of 94 stations, was 6.34 inches which is 2.69 inches above normal. Portland in the extreme southeastern portion and Dutton and Ozark in the northwestern portion were the only stations out of the 66 with records of 10 years or more with negative departures. Monthly totals ranged from 2.49 inches at Portland to 9.19 inches at Georgetown. Bee Branch in the north-central portion of the State reported 9.00 inches and a number of stations over 8.00 inches. Gravette in Benton County reported a trace of snow on the 26th and a few stations a trace of sleet on the same date. The average number of rainy days was 9 though a number of stations reported a dozen or more, and one 19 rainy days. The greatest amount measured in any 24-hour period was 5.00 inches at Bee Branch on the 20th.

The prevailing wind was from the south. On the 20th high winds swept over the southern part of the State causing property damage estimated at several thousand dollars and injuring at least seven persons. The damage was confined principally to Bradley, Union, and Jefferson counties. Losses were as follows:

Ingalls in Bradley county, $2,000 damage to buildings. Pine Bluff, $10,000 damage to buildings, household effects, shrubbery, etc.; one person slightly injured. Strong and vicinity, $5,000 damage to buildings; three persons injured. Wilmar, $1,500 damage to lumber mill, cotton gin, and buildings; two persons slightly injured.

OL. XXXVI LITTLE ROCK, ARK., DECEMBER, 1931 No. 12

GENERAL SUMMARY

Unusually warm weather prevailed during December 1931 nd, although the highest temperature recorded was only 78°, his is the second warmest December on record for the past 40 ears, being exceeded only by that of December 1923 when e mean was 49.1°. Temperatures were somewhat below ormal the first three days of the month and cooler weather gain overspread the State on the 5th and 6th and on the 14th nd 15th when the lowest temperature generally occurred, but om the 17th to the close of the month temperatures were continuously above normal with departures reaching as high as 3° at Little Rock on the 23d. The mean temperature for the tate, as determined by the records of 61 stations, was 48.7° hich is 6.2° above normal, all stations with records of 10 ears or more showing positive departures. Monthly means nged from 43.7° at Lurton to 52.0° at Pine Bluff. The hight temperature recorded was 78° at Pine Bluff on the 23d, e lowest 17° at Lead Hill on the 15th. Departures of over ° above normal occurred in northern border counties. The eatest daily range was 44° at Okay on the 25th.

The average precipitation for the State, based on the reports 93 stations, was 7.79 inches which is 3.70 inches above ormal, this being the highest State average since 1892. Rainll was light in northern border counties and somewhat below ormal in the Fort Smith area but was excessive in the southn half of the State with four stations reporting monthly totals over 20.00 inches and a number of stations over 10.00 inches. l Dorado with a total of 23.86 inches established a new ecord for monthly rainfall in Arkansas, the previous record eing 23.80 inches at Story in April, 1927. The average numer of rainy days for the State was 14 but Highland in the outhwestern portion reported 23 rainy days and Clarendon nd El Dorado 21. Rainfall occurred in some portions of the tate except on the 5th and 6th, the 15th, and from the 25th the 28th. The greatest amount measured in any 24-hour eriod was 5.65 inches at Bee Branch on the 30th but a numer of stations reported excessive rains the night of the 12th-3th, from the 16th to the 19th, and on the 30th and 31st.

Tornadoes:—Dec. 11, 1 mile north of Texarkana, 2:30 a.m. om sw, destructive path 600 ft. wide, 2 1-2 miles long, 2 illed, 7 injured, property damage $10,000. Dec. 12, Waldo, 1:45 p.m., from sw, destructive path 600 ft. wide, 35 miles ng, none killed, 2 injured, property damage $500,000. Dec. 3, near Buena Vista, 8 miles southwest of Camden, 12:15 a. ., from w, destructive path 300 ft. wide, 35 miles long, none illed, 4 injured, property damage $1,500. Dec. 13th, near amden, 12.30 a.m., from sw, destructive path 1-2 mile wide, 5 miles long, 1 killed, 17 injured, property damage $750,000. he same tornado probably passed through Waldo, Buena Vis-, and Camden. Dec. 30th, near Line, 4 p.m., from sw, desructive path 1200 ft. wide, 2 1-2 miles long, none killed, 3 injured, $1,525 damage to timber, buildings and contents. Dec. 12th-13th, excessive rain in White County, $25,000 damage to roadbeds, culverts, and bridges. Dec. 30th near Monticello, barn struck by lightning, $500 damage. Dec. 29th-30th, Morrillton, wind and electrical storm, $5,000 damage to Morrillton Cotton Oil Mills, barns, buildings, and contents. Dec. 31st, Perry, excessive rain, $2,300 damage to buildings and contents from overflow of town branch.

VOL. XXXVI LITTLE ROCK, ARK., YEAR, 1931 No. 13

GENERAL SUMMARY

Temperature and precipitation records during 1931 were well within the limits established in previous years. Mild weather prevailed during January and February and, although no extremely cold weather was experienced during March, this was the coldest March since 1924. Temperatures continued below normal during April and May with killing frosts occurring as late as April 22d in western and northern sections. The month of June brought temperatures above the average and, although maxima were not unseasonably high during the latter part of June and the first three days of July, more people died from heat prostrations than was ever known before in Arkansas. Much cooler weather prevailed during August but beginning with September temperatures were above normal for the remaining months of the year.

The mean temperature for the year was 62.5° which is 1.3° above normal. Of the 53 stations for which normals have been computed, 3 stations showed negative departures, two were normal, and all others positive. Monthly means for all stations were below normal in March, April, May, and August, while, with only a few exceptions they were above normal during other months. Annual means ranged from 56.3° at Dutton to 65.9° at El Dorado. Extremes ranged from 0° at Corning on January 15th to 107° at Amity on June 30th.

The average precipitation for the State was 46.98 inches which is 1.25 inches below normal. Of the 65 stations with records of 10 years or more, 31 showed negative departures and 34 positive. January was dry, being the third driest on record, but was followed by precipitation above normal in February. The three following months had negative precipitation departures but July was the wettest July since 1905 and was followed by a wet August, especially in the northwestern part of the State. September was dry, this being the driest September since 1928. October was slightly deficient in precipitation but precipitation was excessive in November and December, especially in central and southern sections of the State. From April 1st to September 30th, rainfall was about 81% of the normal with the months of July and August accounting for approximately 50% of the amount for the period. Annual amounts were below normal in the upper watershed of the Ouachita River, in the Ozarks and central portion, and in extreme northeastern and extreme southeastern counties; above in most other sections with the greatest positive departures occurring in counties in the lower Ouachita Basin and in the southwestern portion of the State.

The last killing frost in spring occurred from March 10th to March 17th in most sections of the eastern and southern portions of the State and as late as April 22d in western and northwestern portions where considerable damage resulted to fruit, strawberries, and truck crops. The first killing frost in autumn occurred in many sections either October 31st or November 1st but because of local conditions adjacent stations in central, western, and northeastern counties showed wide variation in injury to vegetation. A number of stations reported killing frost about December 2d but a few in extreme southern counties had no killing frost until in January 1932.

Eleven people were killed and eight injured during electrical storms in May, June, and July and considerable damage resulted from hailstorms in April, May, and June. Tornadoes occurred in April and December in which three people were killed, 33 injured, and the property damage was estimated at $1,273,025. For a detailed account of losses resulting from hailstorms, tornadoes, excessive rains, etc., see tabulated data, page 55.

WEATHER BY MONTHS

January:—Precipitation was 3.10 inches below normal with monthly totals ranging from a trace at Harrison to 3.40 inches at El Dorado. Thirty-four stations reported a measurable amount of snow, the average of which was 1.2 inches. Temperature was somewhat above normal, the lowest being 0° at Corning on the 15th which was the lowest for the year. Positive departures were especially noticeable in northern and northwestern portions.

February:—The mild weather of the latter part of January continued for the most part during February. Farm work advanced rapidly during the first week. Oats were sown and potatoes, truck, and gardens planted in many sections. The frequent rains from the 6th to the 17th prevented much farm work but by the close of the month much land had been prepared and some corn planted in extreme southern counties. Fruit buds were much farther advanced than usual and peaches and plums were blooming in central and southern counties.

March:—Although minimum temperatures were not unusually low, the daily average exceeded the normal for only eight days at both Fort Smith and Little Rock and for only four days at Memphis. Freezing temperatures overspread the State the first of the month with many stations reporting sleet and snow from the 2d to the 4th. The coldest weather occurred in nearly all sections about the 10th of the month. Eighteen stations reported a measurable amount of snow, the average of which was 2.0 inches. Monthly precipitation totals ranged from 2.73 inches at Portland to 6.83 inches at Wynne.

April:—Precipitation was below normal in April, this being the third month this year with a negative precipitation departure. The geographical distribution was irregular with nearby stations showing a wide divergence in monthly totals. Considerable damage to fruit and early strawberries in western and northwestern sections resulted from the frost and freezing temperatures of the 6th and again from the cold spell of the 22d. Much cotton and corn had to be replanted because of the cold, wet soil. Hailstorms did considerable damage in western border counties on the 17th and the 25th.

May:—Precipitation for May was below normal, this being the driest May since 1926. Though some stations in west-central and northwestern portions reported as many as 12 and 13 rainy days, only 6 out of the 65 stations with records of 10 years or more reported precipitation above normal. Cool weather overspread the State on the 6th and 7th bringing freezing temperatures to some western and northwestern stations and light frost to most of the northern half of the State on the 7th. Light frost again occurred in extreme northern counties on the 23d. The weather was too cool for the growth of cotton during most of the month and considerable replanting was necessary. Practically all the corn crop was planted during the first half of the month but growth was slow and some had to be replanted. Wheat, winter oats, and hay crops yielded much better than usual.

June:—Although the mean temperature for the State was above normal, the minimum of 35° at Dutton on the 1st is the lowest temperature ever recorded for the month of June, the next lowest being 37° in June, 1917. The first part of the month was cool but after the 9th temperatures were continuously above normal The geographical distribution of rainfall was very irregular. On the night of the 6th-7th showers with severe local thunderstorms swept over most of the State, causing considerable damage. Hail in the vicinity of Imboden and Ravenden in Lawrence and Randolph counties did damage estimated at $100,000.

July:—The hot weather of the latter part of June continued for the first four or five days of July, the highest temperature recorded being 106° on the 2d and 3d. Precipitation was above normal, this being the wettest July since 1905. Monthly totals ranged from 2.13 inches at Morrillton to 13.00 inches at Whitecliffs. Rainfall was generally light in the western half of the State during the first half of the month but thereafter showers were frequent in nearly all sections. Thunderstorms were unusually severe.

August:—The mean temperature for August was 3.1° below normal, all stations for which normals have been computed showing negative departures. Precipitation was light in the southern half of the State the first 15 days of the month but excessive in the Ozarks and in northern border counties. Showers were frequent the latter half of the month, but the northern half of the State again received the greatest amount. Monthly totals ranged from 1.29 inches at Little Rock to 14.67 inches at Eureka Springs. The weather was favorable for the growth of all crops. The greater portion of the corn crop had matured by the close of the month, the yield being the best for many years. All minor crops yielded abundantly.

September:—This was the driest September since 1928. Showers with locally heavy rains occurred on the 2d and 3d, but thereafter little or no rain fell in west-central, northwestern, and southeastern sections and only scatteringly in other portions. Only two stations reported positive departures. Monthly totals showed wide variation ranging from none at Magnolia to 4.32 inches at Whitecliffs. Temperatures were above normal, this being the warmest September since 1925 and the fifth warmest since 1891.

October:—Unusually warm weather prevailed during the month, the mean temperature being exceeded only by that of October 1897. Temperatures with a few exceptions were above normal until about the 27th but were from 10° to 15° below the latter part of the month. The weather was favorable for cotton, the yield being the best in the history of the State, but meadows, pastures, late corn, and fall truck were damaged by the dry weather. The soil was too dry at the close of the month for fall plowing and seeding. Very little damage resulted from the frosts and freezing temperatures of the 31st as most crops were matured.

Continued on page 56.

TEMPERATURE AND PRECIPITATION FOR ARKANSAS, 1931

Month	Temperature, in degrees Fahrenheit				Precipitation, inches					Sky			Prevailing direction of the wind

The departures from normal temperature and precipitation are computed only for stations having ten or more years record, but all complete reports are used in determining section means. T., less than 0.01 inch rain or melted snow. Reference letters ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing: for example, ^{b} represents two days missing. † Also on later dates. ‡‡ Post-office addresses of these stations as follows:-Big Lake Outlet, Manilla, Ark., Freeman Springs, Dover, Ark., Index, Route 5, Texarkana, Ark., Lutherville, R. F. D. No. 1, Lamar, Ark. Springbank, Doddridge, Ark.

Monthly and Annual Mean Temperatures for the Year 1931, with Departures from the Normal

November:—The mean temperature of 57.6° for November equaled the record of the warm November of 1913 and was exceeded only by that of November 1909. All stations for which normals have been computed showed positive departures with several stations in the northern half of the State reporting departures of 7.0° or more. Practically no rain fell in the State until the 10th and then only scatteringly until about the middle of the month, but thereafter showers were frequent with heavy rains occurring on the 20th and during the latter part of the month. Monthly totals ranged from 2.49 inches at Portland to 9.19 inches at Georgetown. On the 20th high winds swept over the southern part of the State causing property damage estimated at several thousand dollars and injuring at least seven persons.

December:—December was the second warmest December on record, all stations with records of 10 years or more showing positive departures. Departures of over 8.0° occurred in northern border counties. Precipitation was 3.70 inches above normal, this being the wettest December since 1892. Rainfall was light in northern border counties and somewhat below normal in the Fort Smith area, but was excessive in the southern half of the State with four stations reporting monthly totals of over 20.00 inches. El Dorado with 23.86 inches established a new record for monthly rainfall in Arkansas. The average number of rainy days was 14 but Highland reported 23 rainy days and Clarendon and El Dorado 21. Tornadoes occurred on the 11th, 12th, and 30th in which three people were killed, 33 injured, the property damage being estimated at $1,263,025.

VOL. XXXVII LITTLE ROCK, ARK., JANUARY, 1932 No. 1

GENERAL SUMMARY

The mean temperature for January 1932 was 5.2° above normal, this being the warmest January since 1923 and the fifth consecutive month with a positive departure. The mild weather of the three preceding months continued for the most part during January. Temperatures were below normal only 5 or 6 days during the month with cold spells occurring during the first decade and the last two days when the lowest was recorded at nearly all stations. Positive departures reached as high as 26° at Little Rock and 28° at Memphis on the 14th. The mean temperature, as determined by the records of 64 stations, was 46.2° which is 5.2° above normal, all stations far which normals have been computed showing positive departures. Monthly means ranged from 46.9° at Dutton to 51.2° at Portland. The highest temperature recorded was 80° at Dumas on the 14th, 16th, and 17th; the lowest 11° at Eureka Springs on the 30th. The greatest daily range was 46°, occurring at Calico Rock on the 20th and at Ozark on the 28th.

This was the wettest January on record, surpassing the corresponding wet months of 1916 and 1930. Rainfall was heavy in nearly all sections of the State and especially so in the basin of the Ouachita River and in the southeastern part of the State. The average precipitation, based on the reports of 96 stations, was 9.67 inches which is 5.43 inches above normal, all stations except Dutton with records of 10 years or more showing positive departures. Monthly totals ranged from 3.35 inches at Dutton to 16.51 inches at Crossett.

Since the 15th of November rainfall has been excessive in the southern portion of the State with a number of stations reporting over 30.00 inches for the two and one-half months period. Crossett since that time has received 41.79 inches with 36.98 inches falling in December and January; El Dorado 44.92 inches with 36.52 inches in December and January; Portland 35.53 inches with 33.04 inches in December and January; Warren 44.67 inches with 35.86 in December and January; and Yancopin 37.64 inches with 31.76 inches in December and January.

Thousands of acres of land were submerged in the lower basin of the Ouachita River during the month. Flood stage at Camden was reached on the 7th and a crest of 38.0 feet occurred on the 9th. The frequent heavy rains prevented much fall and at the close of the month the high water continued. Flood stages occurred on the Petit Jean, Black, and Cache Rivers and on the lower White but only moderately high stages occurred on the Arkansas. The loss resulting from the high water was as follows: On the Ouachita River, $144,000; on White, $15,700; on the Arkansas, $7,500.

VOL. XXXVII LITTLE ROCK, ARK., FEBRUARY, 1932 No. 2

GENERAL SUMMARY

The mild weather of December and January continued during the month of February, making this the third warmest February on record, February 1930 being the warmest with a mean temperature of 52.2°. A cold spell overspread the State on the 4th and 5th and temperatures were again below normal for two or three days about the middle of the month, but with the exception of these four or five days they were continuously above with departures as high as 28° above normal at Little Rock and 29° above at Fort Smith on the 10th. Temperatures were freezing or below for only two days at Little Rock and for only three days at Fort Smith during the month. Though the average temperature this past winter of each of the three months of December, January, and February has been exceeded some two or three times during the past 40 years, the average this year of the three taken together makes this the mildest winter on record. The mean temperature, as determined by the records of 63 stations, was 52.0° which is 8.7° above normal, all stations for which normals have been computed showing positive departures. Departures as high as 10° above normal occurred in the northern part of the State. The highest temperature recorded was 86°, occurring at Dumas on the 10th and at Eureka Springs and Grannis on the 28th; the lowest was 9° at Sunset on the 4th. The greatest daily range was 51° occurring at several stations either the first or latter part of the month.

Precipitation was general over the State the first part of the month and again on the 11th, and from the 13th to the 21st with only a day or so intervening, but after the 22d very little occurred. On the night of the 10th-11th thunderstorms accompanied by high winds occurred in most sections but damage was confined principally to areas around Fort Smith and Batesville and in northeastern counties. Seven stations reported a trace of snow on the 4th and one a trace on the 14th. The average precipitation for the State, based on the reports of 95 stations, was 4.72 inches which is 1.42 inches above normal. Monthly totals ranged from 1.14 inches at Gravette to 8.14 inches at Prescott with stations in the Ozarks and northern border counties receiving the least and those in southern and east-central sections the most. The greatest amount measured in any 24-hour period was 3.70 inches at Hope on the 15th. The average number of rainy days was 9.

The heavy rainfall of January left the soil wet in all sections and it was nearly the middle of the month before much plowing was done. The mild weather, however, was favorable for the growth of all winter crops and all are in good to excellent condition. Fruit buds began developing much earlier than usual and peaches, plums, and early strawberries were blooming in many sections by the close of the month. T.A.M.

Damage from Windstorms

Fort Smith, February 11th, $2,000 to buildings, fences, and communication lines. Near Batesville, February 11th, $1,000 damage to small buildings and fences.

VOL. XXXVII LITTLE ROCK, ARK., MARCH, 1932 No. 3

GENERAL SUMMARY

Temperatures were above normal the first four days of March with departures reaching as high as 20° in all sections on the first, but from the 5th to the 15th they were from 15° to 30° below normal, stations even in southern border counties reporting minima of from 18° to 20° on the 9th. From the 15th to the close of the month temperatures were above normal for about 8 days, maxima for the month occurring at most stations on the 20th. The highest temperature recorded was 88° at Amity on the 20th; the lowest 2° at Sunset on the 9th. The mean temperature for the State, as determined by the records of 60 stations, was 48.2° which is 4.4° below normal, this being the third consecutive March with the mean below normal and the first month since August 1931 with a negative departure.

The average precipitation for the State, based on the reports of 93 stations, was 4.47 inches which is 0.21 inch below normal. Rainfall was general over the State from the 3d to the 5th with stations in the southern half generally reporting over 2.00 inches. From the 5th to the 12th much of the precipitation fell in the form of sleet or snow, 61 stations reporting a measurable amount of snow during this period. The average amount was 1.1 inches which is the greatest amount for the winter 1931-32, practically no snow occurring before this month. From the 16th to the 22d rainfall was light to moderate with only locally heavy rains on the night of the 16th-17th, but from the 27th to the 31st nearly all sections except the northwestern portion reported from 2.00 to 3.00 inches. Monthly totals ranged from 1.63 inches at Harrison to 7.33 at Arkadelphia. The greatest amount measured in any 24-hour period was 3.43 inches at Conway on the 27th and the average number of rainy days was 9.

On the night of the 16th-17th windstorms occurred in many sections of the State and a small tornado at Little Rock. The tornado struck in the southwestern section of the city about 9:30 p. m. and traveled in an easterly direction across the south end. Five people were injured and property damaged to the extent of approximately $57,000. This same tornado probably struck again near Scott, 13 miles east of Little Rock, causing considerable property damage. Windstorms again were reported in many sections of the State on the night of the 26th-27th but property damage was confined principally to northern and southern sections.

The cold weather during the first half of the month stopped all outdoor activities. The ground was frozen in northern and central sections from the 6th to the 13th and all early truck crops were severely damaged. Peaches and pears were in bloom and these two crops were practically destroyed. Early strawberries were damaged somewhat and retarded but sufficient buds were left to produce a good crop. T.A.M.

Tornadoes:

Little Rock to Scott:—16th, 9:30 p.m., from w, destructive path 300 feet, none killed, 5 injured, property damage $57,000.

Salem (2 1-2 miles ne):—16th, 8:30 p.m., from sw, path unknown, none killed nor injured, $1,500 damage to timber, barns, and contents.

Windstorms:— On the night of 16th-17th.

Atkins, $500 damage to buildings.

Calico Rock, $500 damage to billboards, telephone lines, and buildings.

Casa, $200 damage to barns and small buildings.

Crawford County, $2,000 damage to buildings.

Eureka Springs, $100 damage to stone arch over highway.

Paris, $7,500 damage to buildings.

Piggott, (6 miles north), $1,500 damage; two barns destroyed 4 horses killed, other livestock crippled.

St. Joe, $3,000 damage to buildings.

On March 21st.

Bentonville, $75 damage to hanger a airport.

El Dorado, $500 damage to signs and buildings.

Pine Bluff, $1,000 damage to buildings.

Prescott, $700 damage to buildings, contents, and electrical equipment.

Vol. XXXVII   Little Rock, Ark., April, 1932   No. 4

GENERAL SUMMARY

The mean temperature for April, 1932 was above normal with warm weather prevailing for the first seven days of the month and later from the 19th to the 25th. Freezing temperatures occurred at only five stations located in the more mountainous portions, Batesville and Lead Hill reporting a temperature of 32° on the 1st, Mount Ida and Thornburg 31° on the 12th, and Dutton 28° on the 14th. Heavy frost occurred at two stations, Harrison located in a northern border county reporting heavy frost on the 8th and 9th and Brinkley heavy frost on the 15th. Light frost was reported from a number of stations on the 12th and 15th and at two stations along the border in the northeastern portion on the 27th. However, practically no damage resulted to growing vegetation from frost during the month.

The mean temperature for the State, as determined by the records of 61 stations, was 63.7° which is 2.2° above normal, all stations for which normals have been computed showing positive departures. Monthly means ranged from 58.6° at Dutton to 67.2° at El Dorado, a difference of 8.6° between the Ozarks and the southern border counties. Departures ranged from 0.4° above normal at Marshall to 4.2° above at Gravette and Harrison. The highest temperature recorded was 92° at Osceola on the 21st; the lowest 28° at Dutton on the 14th. Maximum temperatures occurred generally about the 20th or 21st and minimum temperatures about the 12th.

Precipitation was decidedly deficient in nearly all portions of the State, only four stations with records of 10 years or more showing positive departures. Showers fell generally in four periods: from the 6th to the 11th, the 16th to the 19th, the 22d to the 25th, and on either the 29th or 30th. The average precipitation for the month was 2.85 inches which is 2.20 inches below normal. Of the 93 stations reporting, twenty-two received less than 2.00 inches while six reported over 5.00 inches. Monthly totals ranged from 0.71 inch at Cotter to 7.02 inches at Marked Tree. The greatest amount measured in any 24-hour period was 4.53 inches at Marked Tree on the 8th. No snowfall was reported. The average number of rainy days was 7.

The weather as a whole during April was favorable for farm work. The heavy rains of the latter part of March in connection with the showers from the 7th to the 11th kept the soil too wet in the eastern and southern portions for preparation and planting, but by the middle of the month the planting of corn had begun in nearly all portions and cotton was being planted in southern and central portions where the soil was in condition. Cool nights retarded the germination and growth of cotton about the middle of the month and again the latter portion, but in many localities by the close of the month early cotton was being worked out and stands were usually good. In some sections the soil was getting dry by the latter part of the month and truck crops, wheat, and oats were needing rain. The marketing of strawberries began in the southwestern portion of the State about the 20th but the crop is late and carlot shipments did not begin until the latter part of the month. Streams in nearly all portions of the State were at low stages during the month with no flood damage reported.

Windstorms were not as destructive as they were in the preceding month. High winds were reported from the northwestern portion of the State on the 1st or 2d, from a few stations on the 6th and 7th, and more generally on the 24th or 25th. On the 7th, a windstorm demolished a small house at Lepanto, injuring 7 people and causing damage estimated at $300. At 9:00 a. m. on the 25th, a small tornado struck in Mississippi County 4 miles southwest of Osceola and moved northeastward to Osceola. The destructive path was narrow and the greatest damage was in Osceola where two houses were demolished and two cotton gins wrecked, the loss being estimated at $35,000.

Corrections:

Stuttgart, January and February minimum temperatures should be set forward one day.

March, page 9, State average precipitation should be 4.48 inches, departure −0.20.

Climatological Data for April. 1932

VOL. XXXVII LITTLE ROCK, ARK., MAY, 1932 No. 5

GENERAL SUMMARY

The mean temperature for May 1932 was 0.4° above normal while precipitation was deficient in practically all sections, only one station, Danville in the west-central portion, having a positive departure. This is the third consecutive month this year with precipitation below normal, the average being 1.96 inches, and it is the driest May since 1925 when the State average was only 1.88 inches.

The mean temperature for the State, as determined by the records of 62 stations, was 69.5° which is 0.4° above normal. Thirty five stations reported positive departures, 14 negative, and 4 normal. Monthly means ranged from 63.0° at Dutton in the mountainous portion to 72.9° at Warren in the southeastern lowlands. The highest temperature recorded was 96° at Warren on the 15th; the lowest 35° at Thornburg on the 19th. Light frost occurred at Story in the northern portion of of Montgomery County on the 1st and the 13th.

Showers were generally light and scattered during the first 20 days of the month in east-central and northeastern sections and in extreme northwestern and southern border counties. Magnolia in Columbia County had no rain until the 16th and Wynne in Cross County only a trace until the 27th. However, in west-central sections and over the southern slope of the Ozarks, heavy rains fell from the 6th to the 9th, some stations reporting over 2.00 inches during this period. Rainfall, also, was heavier in the Arkansas River Valley and on the western and northwestern slopes of the Boston Mountains. Showers were more general the latter part of the month with locally heavy rains occurring at a few stations where the rainfall was heaviest earlier in the month. The distribution was irregular with nearby stations showing a wide divergence in monthly totals in some sections, especially in the southwestern and northeastern portions. The greatest deficiency occurred in sections embracing the St. Francis and White River valleys and in extreme northwestern and southwestern counties. Monthly totals ranged from 0.28 inch at Gravette to 5.01 inches at Danville. The average precipitation for the State, based on the reports of 94 stations, was 1.96 inches which is 3.15 inches below normal. Thirteen stations had less than 1.00 inch and 55 less than 2.00 inches while 3 had more than 4.00 inches. The greatest amount measured in any 24-hour period was 2.25 inches at Freeman Springs on the 8th. The average number of rainy days was 5.

The weather during the month was favorable for the growth and cultivation of cotton. Stands are good in practically all portions and the crop is clean and well cultivated. Corn made good progress in most portions though some sections need rain badly. Wheat and oats were damaged by the dry weather as were potatoes, truck, and late strawberries but early strawberries yielded much better than usual especially in the White County district where a record crop was produced.

Hail did considerable damage locally in Faulkner, White, and Prairie counties on either the 8th or 9th. The storms usually covered only a few square miles. Hailstones were reported the size of hen eggs at both Des Arc and Vilonia on the 8th and crops suffered severe damage as well as roofs of buildings in the path where heaviest. At Judsonia the damage was confined principally to strawberries which were nearly a total loss in some fields northwest of Judsonia. T.A.M.

Moderate Hail:—Conway, 8th, considerable damage to gardens; Little Rock, 8th, slight damage; 4 miles south of Waldron, 8th, no report on damage; Arlberg, 9th, slight damage to garden truck; Grannis, 27th, slight damage.

Heavy Hail:—Des Arc, 8th, $5,000 damage to crops and roofs of buildings, some livestock killed; Stuttgart, 8th, considerable damage to crops; Vilonia, 8th, $10,000 damage to crops and buildings, mostly buildings; Judsonia, 9th, $20,000 damage to crops, mostly strawberries; Duckett, 27th, slight damage to crops and roofs of buildings.

Windstorms:—Marianna, 8th, $1,000 damage to Miller Lumber Co., smokestacks blown down and machinery damaged; Ozark, 26th, $5,000 damage to buildings, plate glass, and crops.

Lightning:—Fayetteville, 26th, two large barns destroyed by lightning, $5,000 damage; Charleston, 26th, barn struck by lightning and destroyed, loss $500.

VOL. XXXVII LITTLE ROCK, ARK., JUNE, 1932 No. 6

GENERAL SUMMARY

Temperature and precipitation averages were both above normal for June, 1932, this being the second June since 1925 with a positive temperature departure and the first since 1928 with a positive precipitation departure.

Temperatures were above normal for the first eight days of the month and later from the 16th to the 24th with departures as high as 10° above normal in the western portion of the State on the 19th. Although no unusually high temperatures were reported, one person died at De Witt on the 21st from heat prostration. The mean temperature for the State for the 62 stations reporting was 78.9° which is 2.0° above normal, all stations except Marshall for which normals have been computed having positive departures. Monthly means ranged from 72.6° at Dutton to 82.8° at El Dorado. The highest temperature recorded was 103° at Dumas on the 19th and 20th, and at Hot Springs on the 20th; the lowest, 50° at Dutton on the 11th. The greatest daily range was 41° at Mount Ida on the 8th.

The distribution of rainfall during the month was irregular with most of the precipitation occurring during thundershowers. The northeastern portion of the State and counties along the southern border again received the least amount of rain as they did in the preceding month. Rainfall was heavy in west-central and northwestern sections on the first but elsewhere only light and scattered. Showers occurred in most sections from the 8th to the 15th though in the northeastern portion and in southern border counties very little rain fell until the latter part of the month. From the 24th to the 30th showers were reported nearly every day in most sections with a number of stations receiving heavy rains during this period. The average precipitation for the State, based on the reports of 94 stations, was 4.86 inches which is 0.76 inch above normal. Of the stations with records of 10 years or more, 43 showed positive departures and 27 negative. Six stations reported over 8.00 inches and 13 others over 7.00 inches, while 8 received less than 2.00 inches. Monthly totals ranged from 0.75 inch at Blytheville in a northeastern county to 9.15 inches at Center Point in the southwestern portion. The greatest amount measured in any 24-hour period was 5.50 inches at Highland on the 28th. The average number of rainy days was 10 though one station reported 16 and four others 15 rainy days.

The weather was generally very favorable for cotton the first half of the month except that the soil was too dry in some localities in northeastern and southern portions, but the frequent rains the latter half caused rank growth in some sections. Chopping was completed even in most northern portions by the 10th of the month and fields were clean and well cultivated, but the frequent showers and the cloudy weather the latter half caused numerous reports of grassy fields. There was an increase in weevil activity in sections bordering on the Arkansas and Mississippi rivers the latter part of the month but little damage was reported elsewhere. Corn was usually well cultivated during the month and in good condition though fields were becoming grassy the latter portion where rainfall was heaviest. The weather was favorable for meadows, pastures, and truck crops except in a few localities in northeastern and southern border counties where the soil was too dry.

Moderate Hail:—Arkansas City, 9th, considerable damage to crops; Morrillton, 14th, considerable damage to truck crops.

Heavy Hail:—Little Rock 14th, considerable damage to roofs of buildings; Glenwood, 21st, $600 damage to truck crops.

Killed by lightning:—Near Benton on 8th, one; near New Blaine on 24th, one; near Russell on 28th, one; near Carthage on 30th, one.

Damage from lightning on 24th:— Near Cabot, 4 horses killed, loss $300; near Stuttgart, large barn and contents destroyed, loss $1,700.

VOL. XXXVII LITTLE ROCK, ARK., JULY, 1932 No. 7

GENERAL SUMMARY

Although no unusually high temperatures were recorded during July, two persons died from heat prostration on the 15th near Pine Bluff, one near Blytheville on the 16th, and one near Berryville on the 21st. From the 10th to the 16th considerable loss of livestock was reported as directly attributable to the heat. In Mississippi County over 100 mules died, in Faulkner County 15, and a large number in Phillips County. The mean temperature for the State, based on the reports of 63 stations, was 82.5° which is 2.3° above normal, all stations except three for which normals have been computed showing positive departures. Monthly means ranged from 78.0° at Dutton to 85.2° at both Center Point and Magnolia. The highest temperature recorded was 108° at Corning on the 16th; the lowest, 50°, at Dutton on the 2d. The greatest daily range was 35° at Corning on the 16th.

Rainfall was excessive in many sections of the State during the first decade with most stations reporting the greater portion of the monthly total during this period. On the 3d-4th a number of stations reported from 3.00 to 4.00 inches. In Faulkner County a small levee protecting about 1,000 acres of land broke and the land was inundated for a short time. In Pulaski County damage estimated at several thousand dollars was done to crops, highways, and private lakes where dams had been constructed. The dam at the Shrine Country Club gave way following the downpour of the night of the 3d-4th and in turn the dam at the Spring Lake Country Club lower down the stream went out. Considerable damage resulted to highways crossed by this stream and crops in the lower portion of the county were inundated. A passenger train of the Missouri Pacific Railroad was derailed near Higgins, 10 miles southeast of Little Rock. The train left the rails as the result of a small washout, ploughing up 140 feet of track and roadbed before the locomotive halted. Only scattered showers were reported during the middle of the month but during the last decade rainfall was fairly general with heavy rains being reported from a number of stations during this period.

The average precipitation for the State for the 94 stations reporting was 5.00 inches which is 1.25 inches above normal. Of the stations with records of 10 years or more, 50 had positive departures and 20 negative. Monthly means ranged from 1.67 inches at Fort Smith to 12.31 inches at Thornburg. Two stations reported monthly totals of over 10.00 inches, two others over 9.00 inches, four others over 8.00 inches, and a number of stations over 6.00 inches. Counties along the southern, eastern, and northern borders and in the west-central portion of the State generally received the least rainfall, while precipitation was heaviest in the more mountainous portions though some sections in the lowlands received from 6.00 to 9.00 inches.

The heavy rains the first part of the month in connection with the frequent showers the latter part of June caused rank growth of cotton and a decided increase in weevil activity in some sections. Weevil infestation was checked considerably by the hot weather the middle of the month but conditions were again unfavorable the latter part in some central and eastern portions where heavy to excessive rain occurred. Temperatures were a little to high for corn during the second decade and in a few localities the soil was too dry, some fields being damaged, but a large portion of the crop is nearly matured. Meadows, pastures, and truck crops were damaged somewhat in some localities by the hot, dry weather. The heavy rains during the month were very favorable for rice. T.A.M.

Killed by lightning: On July 20th at Emmet, one; on July 23d, near Centerton, one; on July 23d at Portland, one seriously injured; on July 24th at Vesta, two seriously injured; on July 25th near Troy, one killed.

Damage from lightning.—Near Lepanto, July 5th, large barn and contents destroyed, loss $3,500; near Melbourne, July 23d, large barn including feed, tools, stored cotton, etc., destroyed, loss $3,000; near Floyd, July 23d, barn with contents destroyed, loss $1,500.

CLIMATOLOGICAL DATA

ARKANSAS SECTION

HARVEY S. COLE, Meteorologist

VOL. XXXVII LITTLE ROCK, ARK., AUGUST, 1932 No. 8

GENERAL SUMMARY

Although the mean temperature for August, 1932, was not unusually high, temperatures were below normal for only four or five days during the month, the cool weather occurring generally on the 4th and 5th and from the 18th to the 22d. The lowest temperatures for the month occurred at most stations around the 20th and the highest either the first or latter part of the month. The mean temperature for the State, based on the reports of 59 stations, was 81.5°, which is 1.7° above normal, all stations except four for which normals have been computed having positive departures. Monthly means ranged from 73.5° at Dutton to 85.0° at Pine Bluff. The highest temperature recorded was 104° at Texarkana on the 3d and at Ozark on the 6th; the lowest, 47° at Dutton on the 9th. The greatest daily range was 44° at Lead Hill on the 9th.

Heavy rains occurred in much of the northeastern portion of the State on the 3d or 4th but thereafter showers were generally light to moderate in the northern half, light at most stations in the southern, with Amity reporting no rain during the month and Camden and Carthage only 0.05 inch. In some portions of the Ozarks and in the area around Fort Smith rainfall was also very light, while the northeastern portion of the State had seven stations with monthly totals exceeding 4.00 inches. The average precipitation for the State for 91 stations was 1.78 inches which is 1.94 inches below normal. Of the stations with records of 10 years or more, only 6 had positive departures while 63 were negative. Monthly totals ranged from none at Amity to 5.98 at Marshall. Twenty-seven stations had monthly totals of less than 1.00 inch, while 4 stations had over 5.00 inches and 11 others over 3.00 inches. The greatest amount measured in any 24-hour period was 3.28 inches at St. Francis on the 3d. The average number of rainy days was 5.

The weather during August was generally favorable for cotton in most of the lowlands but was too dry for the uplands except in the northeastern portion of the State where rainfall was considerably heavier than in other sections. Sections around Fort Smith and in the Ouachita river basin received very little rain and by the latter part of the month deterioration was general in those areas. The dry weather caused cotton to open early and by the middle of the month several bales had been ginned. Early corn was so nearly matured that it was not materially damaged but late corn was seriously damaged in many localities as were all minor crops where rainfall was light. Grapes yielded abundantly but the price was low except for the early crop. The weather was favorable for rice and the yield is generally satisfactory.

T.A.M.

Killed by Lightning:—Near Melbourne, August 11th, one.

Damage from Lightning:—Near Russell, August 9th, barn with contents destroyed, loss $1,000; near Helena, August 16th, cotton gin destroyed, loss $15,000.

Corrections, July, 1932

Amity, maximum temperature 31st should be 97°; mean maximum temperature 95.2°; mean temperature 83.3°; departure +2.6°.

Correct river stages as follows:

Camden, Ark.:—Subtract 0.2 ft. from stages of —2.0 ft. to 5.0 ft. from June 7, 1926, to June 24, 1932; subtract 0.4 ft. from stages from 5.1 ft. to 20.0 ft. from June 8, 1926, to June 24, 1932; subtract 0.1 ft. from stages from 20.1 ft. to 35.0 ft. from Sept 3, 1924, to June 24, 1932.

Danville, Ark.:—Subtract 0.1 ft. from all stages below 20 ft. from Jan. 1, 1932, to June 8, 1932.

Georgetown:—Add 0.3 ft. to stages from 22.1 ft. to 29.5 ft. from March 8, 1927, to March 10, 1929; add 0.2 ft. to stages from 20.6 ft. to 25.0 ft. from March 11, 1929, to June 2, 1932; add 0.3 ft. to stages from 25.1 ft. to 29.9 ft. from March 11, 1929, to June 2, 1932.

ARKANSAS SECTION

HARVEY S. COLE, Meteorologist

VOL. XXXVII LITTLE ROCK, ARK., SEPTEMBER, 1932 No. 9

GENERAL SUMMARY

Temperatures were above normal the first five or six days of September and again from the 11th to the 21st, while they were generally below the remainder of the time. The warmest weather occurred during either the first three days of the month or on the 17th or 18th, the coldest generally the latter part of the month though a few stations reported the lowest on the 9th or 10th. The mean temperature for the State was 73.8° which is 0.4° below normal. Of the stations for which normals have been computed, 29 had negative departures, 20 positive, and 3 were normal. Monthly means ranged from 67.6° at Marshall to 77.8° at Highland and Center Point. The highest temperature recorded was 103° at Conway on the 3d; the lowest, 35° at Dutton on the 27th. Only 15 of the 61 stations reported temperatures of 100° or higher. The greatest daily range was 52° at Eureka Springs on the 15th.

Rainfall was general over the State during the first part of the month with numerous stations in the northern half reporting heavy rains during this period, but in southern and southwestern sections it was generally light to moderate. From the 14th to the 22d showers occurred in nearly all portions, but amounts exceeding 1.00 inch on any one day were confined principally to the eastern half of the State. From the 25th to the 27th the extreme northeastern portion of the State received from 1.00 to over 2.00 inches of rainfall, while the extreme northwestern portion received little or no rainfall and other sections only light to moderate showers. Counties bordering on the Mississippi, the St. Francis, and the Arkansas rivers received the greatest amount of rainfall with 2 stations reporting over 7.00 inches and 6 others over 5.00 inches, while sections around Ft. Smith and in the Ouachita River basin received the least with 3 stations reporting less than one half inch and 10 others less than 1.00 inch. Rainfall this month like that of the preceding month was light in southwestern and extreme western portions of the State and in the lower Ouachita River Basin, Arkadelphia during the months of August and September receiving only 1.07 inches, Camden 0.90 inch, Ft. Smith 0.87 inch, Hope 0.40 inch, and Okay 1.30 inches. The average precipitation for the State, based on the reports of 93 stations, was 2.54 inches which is 0.82 inch below normal. Only 9 of the stations with records of 10 years or more had positive departures, all other departures being negative. Monthly totals ranged from 0.30 inch at Hope to 7.99 inches at Blytheville. The average number of rainy days was 6.

The rainy weather of the first part of the month was unfavorable for cotton in some sections of the lowlands but elsewhere was generally beneficial. Growth was stopped in southern and southwestern sections of the State due to lack of rain and cotton opened prematurely. Late corn was badly damaged in central, extreme western, and southwestern portions as were meadows, pastures, and other minor crops. More favorable conditions prevailed in the eastern half of the State and soil moisture was generally sufficient for staple crops except in some north-central localities where it was too dry. The weather was favorable for the harvesting of rice. T.A.M.

Killed by Lightning:—Near Batesville, 14th, one.

Damage from Windstorm:—Near Mountainburg, 13th, barn blown down, porch and filling station damaged, loss $500.

Moderate Hail:—Marshall 17th-18th, slight damage; Subiaco 18th, slight damage; Ola 19th, slight damage to open cotton.
